FEATURES

1. **ROM: 8K x 16 bits Flash Program Memory with Page Locker function.**
2. **EEPROM: 128 x 8 bits**
3. **RAM: 496 x 8 bits**
4. **STACK: 8 Levels**
5. **System Oscillation Sources (Fsys) :**
 - Fast-clock
 - ◇ FIRC (Fast Internal RC) : Max. 18.432 MHz (can be trimmed)
 - ◇ FXT (Fast Crystal): 1M~18MHz
 - Slow-clock
 - ◇ SIRC (Slow Internal RC) : 50 KHz @VCC=5V
 - ◇ SXT (Slow Crystal): 32.768KHz
6. **System Clock Prescaler:**
 - System Oscillation Sources can be divided by 1/2/4/16 as System Clock (Fsys)
7. **Dual System Clock:**
 - FIRC+SIRC
 - FIRC+SXT
 - FXT+SIRC
8. **I/O ports: Maximum 26 programmable I/O pins**
 - Open-Drain Output
 - CMOS Push-Pull Output
 - Schmitt Trigger Input with pull-up resistor option
 - Support High sink mode: 70mA @VCC=5V, V_{OL}=0.5V; 140mA@VCC=5V, V_{OL}=1.2V
 - Support constant current Drive mode: 19mA@VCC=5V, V_{OH}=2.5V~3.8V
9. **Power Saving Operation Mode**
 - FAST Mode: Slow-clock can be disabled or enabled, Fast-clock keeps CPU running
 - SLOW Mode: Fast-clock can be disabled or enabled, Slow-clock keeps CPU running
 - IDLE Mode: Fast-clock and CPU stop. Slow-clock, T2, or Wake-up Timer keep running
 - STOP Mode: All clocks stop, T2 and Wake-up Timer stop
10. **3 Independent Timers**
 - Timer0
 - ◇ 8-bit timer divided by 1~256 pre-scaler option, Reload/Interrupt/Stop function

- Timer1
 - ◇ 8-bit timer divided by 1~256 pre-scaler option, Reload/Interrupt/Stop function
 - ◇ Overflow and Toggle out
- T2
 - ◇ 15-bit timer with 4 interrupt interval time options
 - ◇ IDLE mode wake-up timer or used as one simple 15-bit time base
 - ◇ Clock source: Slow-clock (SIRC), F_{sys}/128

11. Interrupt

- Three External Interrupt pins
 - ◇ 1 pin is falling edge wake-up triggered & interrupts
 - ◇ 2 pins are rising or falling edge wake-up triggered & interrupt
- Timer0/Timer1/T2/WKT (wake-up) Interrupts
- ADC Interrupt
- TK (3 Touch Key module)
- I2C Interrupt
- UART Interrupt
- Pin Change Interrupt
- LVD Interrupt

12. Wake-up (WKT) Timer

- Clocked by built-in RC oscillator with 4 adjustable interrupt times
20.5 ms/41 ms/82 ms/164 ms

13. Watchdog Timer

- Clocked by built-in RC oscillator with 4 adjustable reset times
164ms/328ms/655ms/1311ms
- Watchdog timer can be disabled/enabled in STOP mode

14. PWM

- PWM0 :
 - ◇ 16 bits, duty-adjustable, period-adjustable controlled PWM
 - ◇ PWM0 Clock source: System clock or FIRC (18.432MHz) or FIRC*2 (36.864MHz)
 - ◇ PWM0 with 4 output modes
 - ◇ Complementary PWM0 output (PWM0P, PWM0N)
 - ◇ Non overlap time durations adjustable. (0~15 PWM CLK)
- PWM1~5:
 - ◇ 16 bits, duty-adjustable (Independent) , period-adjustable controlled (shared with PWM0)
 - ◇ Clock source (Shared with PWM0)

15. 24-Channel Touch Key with 3 TK-module (TKM0/TKM1/TKM2)

- Each TK module with 8-channel touch key
- Each module include:
 - ◇ 3-bit TK reference clock capacitor adjustment
 - ◇ 8-bit touch key clock frequency select(can be fixed frequency or auto change)
 - ◇ 14-bit TK scan length adjustment
- Interrupt/Wake-up CPU while key is pressed.

16. I2C Interface

- Specific purpose slave I2C interface with interrupt function

17. UART Interface

- 7/8/9 bits mode TX/RX selectable
- Supported Baud-Rate range from 9600bps to 115200 bps with proper selected oscillation frequency and baud rate clock divide
- Automatic parity generation and detection
- Detects Overrun, Frame Error and Parity Error

18. 12-bit ADC Converter with 14 input channels and 1 internal reference voltage

- Internal Reference Voltage: VBG 1.20V±1% @VCC=5V~2.5V, 25°C
- Internal reference voltage: 1/4VCC
- ADC reference voltage: VCC, 2.5V

19. All pin change wake up (negedge and posedge trigger)**20. Reset Sources**

- Power On Reset/Watchdog Reset/Low Voltage Reset/External Pin Reset

21. Low Voltage Reset (LVR) /Low Voltage Detection Flag (LVD) Option:

- 16-Level Low Voltage Reset: 2.05 ~ 4.15 V
- 16-Level Low Voltage Detection Flag (Disable, 2.28V ~ 4.15V)

22. Operating Voltage :

- Fsys= 1 MHz, LVR ~5.5V
- Fsys=18.432 MHz, 2.5~5.5V

23. Operating Temperature Range : -40°C to + 85°C**24. Integrated 16-bit Cyclic Redundancy Check (CRC)****25. Table Read Instruction: 16-bit ROM data lookup table****26. Instruction set: 39 Instructions**

27. Instruction Execution Time

- 2 system clocks (Fsys) per instruction except branch

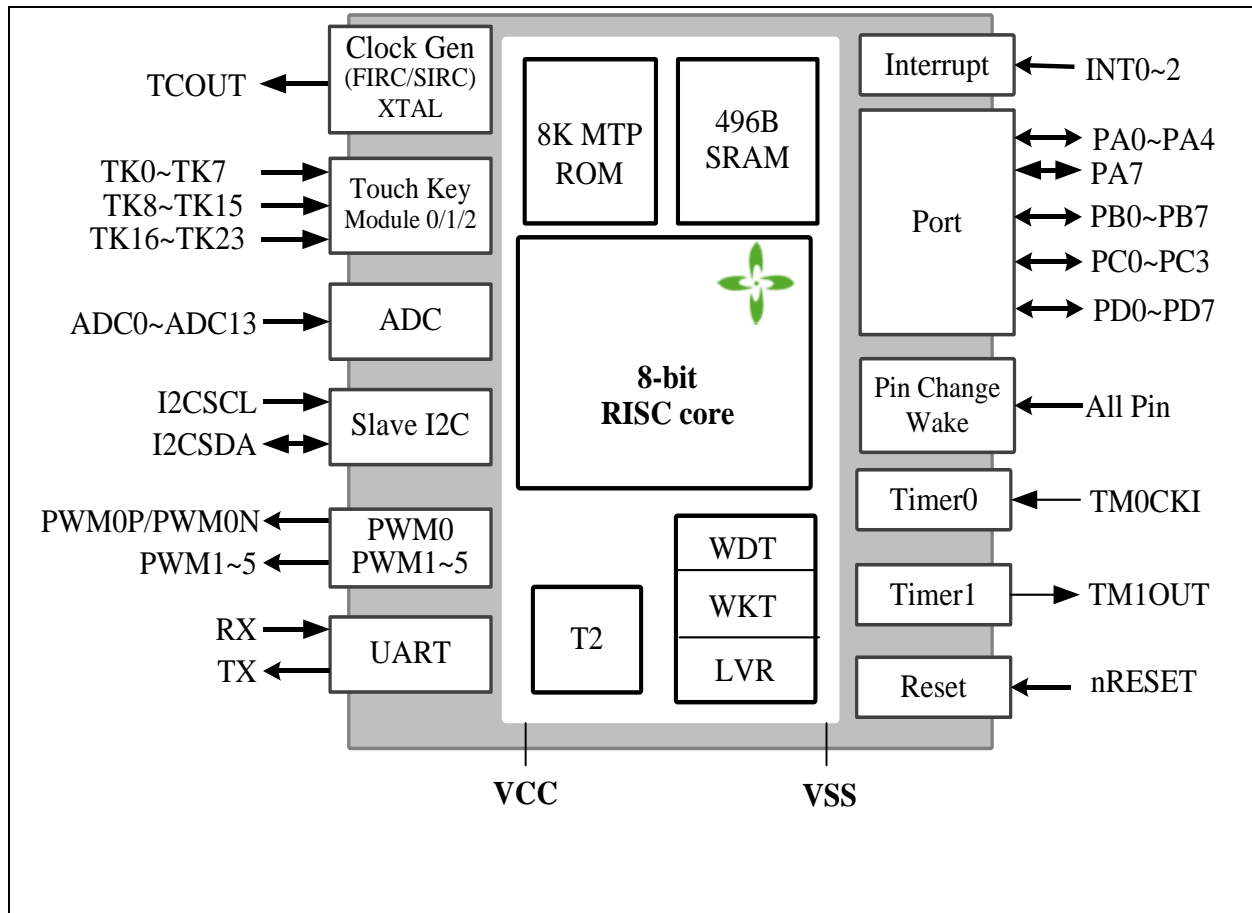

28. Built-in 1/2 bias for software LCD display (4 COM)**29. Programming connectivity support 4-wire (ICP) or 5-wire program****30. Page Locker Size: 512W/640W/768W .../23040W by 128 words step****31. Package Types:**

- SOP-28
- SOP-20
- SOP-16

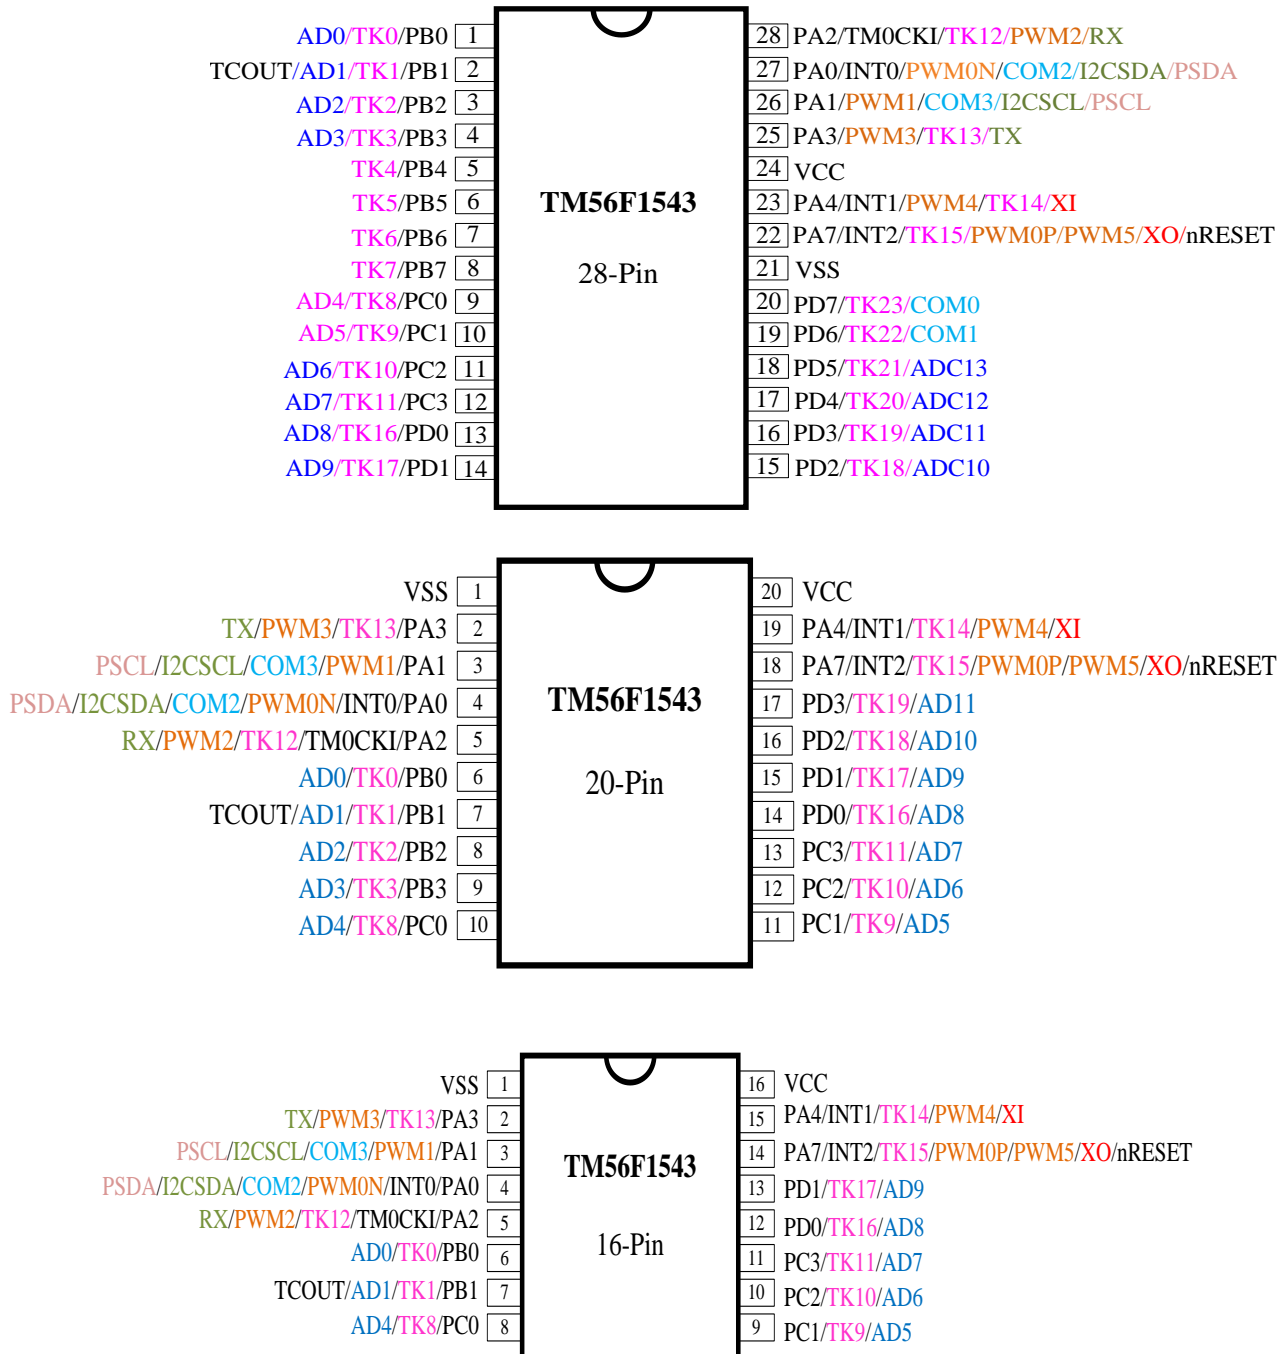

32. Supported EV board (ICE) on Real Chip Debug

- Use PA0/PA1 pin or PC0/PC1 pin
- Share with ICP programming pin

SYSTEM BLOCK DIAGRAM

TM56F1543 Block Diagram

PIN ASSIGNMENT DIAGRAM

PIN DESCRIPTIONS

Name	In/Out	Pin Description
PA7, PA4-PA0	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or open-drain output. Pull-up resistor are assignable by software.
nRESET	I	External active low reset/ Schmitt-trigger input
VCC, VSS	P	Power input pin and ground
INT0-INT2	I	External interrupt input
PB7-PB0	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or open-drain output. Pull-up resistor are assignable by software.
PC3-PC0	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or open-drain output. Pull-up resistor are assignable by software.
PD7-PD0	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or open-drain output. Pull-up resistor are assignable by software.
PWM0P/PWM0N PWM1 PWM2 PWM3 PWM4 PWM5	O	PWM0/PWM1/PWM2/PWM3/PWM4/PWM5 outputs
ADC13~ADC0	I	Analog to Digital Convert input pin
TK7~TK0	I	Touch Key Module 0 input
TK15~TK8	I	Touch Key Module 1 input
TM23~TK16	I	Touch Key Module 2 input
TM0CKI	I	Timer0's input pin in counter mode
TCOUT	O	Fsys/2 clock output
TM1OUT	O	Timer1 overflow toggle output
I2CSCL	I	I2C Serial clock input
I2CSDA	I/O	I2C serial data pin
PSCL	I	I2C Serial clock input for program/ICE
PSDA	I/O	I2C serial data pin for program/ICE
XI, XO	-	Crystal/Resonator oscillator connection for System clock (FXT or SXT)
RX	I	UART receive pin
TX	O	UART transmit pin

Programming pins:

Normal mode (5-wire): VCC / VSS / PA0 / PA1 / PA2

ICP mode (4-wire): VCC / VSS / PA0 / PA1 -When using ICP (In-circuit Program) mode, the PCB needs to remove all components of PA0, PA1.

Pin Summary

Pin number			Pin Name	Type	GPIO				Function after reset	Alternate Function

Symbol : O.D. = Open Drain
P.P. = Push-Pull Output

FUNCTION DESCRIPTION

1. CPU Core

1.1 Program ROM (PROM)

The 8Kx16 bits Flash Program ROM of this device is 8K words, with an extra 32-Word INFO area to store the SYSCFG and another extra 128-Byte EEPROM. The ROM can be written multi-times and can be read as long as the PROTECT and LPROT bits of SYSCFG are not set. The SYSCFG can be read no matter PROTECT or LPROT is set or cleared, but PROTECT bit can be cleared only when User ROM Code area is erased, and LPROT bit can be cleared only when the Lib ROM Code area is erased. That is, unprotect the PROTECT or LPROT bit needs to erase the corresponding ROM area. If LPROT bit is set, the ROM can still be written multi-times in the User ROM Code area to update user ROM code again by writer, but the Lib ROM Code area will not be read or written again by writer until the LPROT bit is cleared. On the other hand, if PROTECT bit is set, the user ROM code area will not be read by writer, and the user ROM code can't be updated until the PROTECT bit is cleared.

1.1.1 Reset Vector (000H)

After reset, system will restart the program counter (PC) at the address 000h, all registers will revert to the default value.

1.1.2 Interrupt Vector (004H)

When an interrupt occurs, the program counter (PC) will be pushed onto the stack and jumps to address 004H.

1.2 System Configuration Register (SYSCFG)

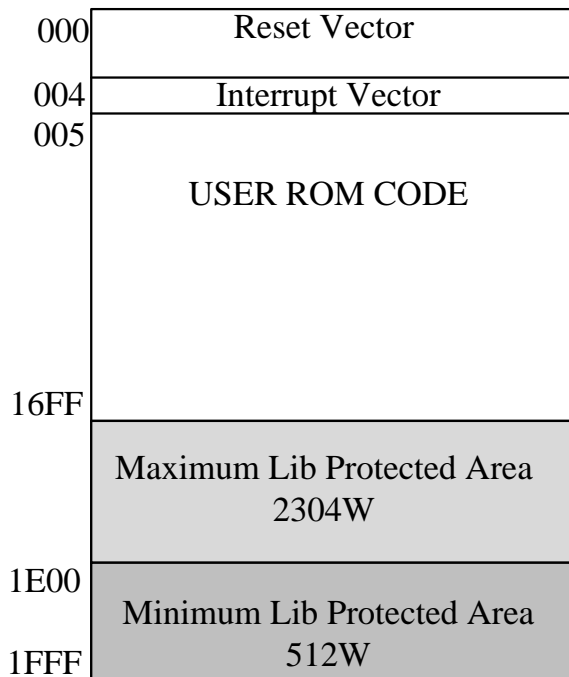

The System Configuration Register (SYSCFG) is located at Flash INFO area; it contains two 16bits registers (CFGWL/CFGWH). The SYSCFG determines the option for initial condition of CPU. It is written by PROM Writer only. User can select LVR operation Mode and chip operation mode by SYSCFG register. The 15th bit of CFGWH is code protect selection bit. If this bit is 1, the data in PROM will be protected, when user reads PROM.

Bit		15~0	
Default Value		0000000000000000	
Bit	Description		
CFGWL (INFO area Address 00)	15~14	Reserved	
	13	LPROT : Lib Code protection selection	
		1	Enable
		0	Disable
	12~9	LSIZE : Lib Size selection	
		1111	2304W
	
0001		512W	
	0000	No use Page locker function	
8~0	Reserved		
CFGWH (INFO area Address 01)	15	PROTECT : Code protection selection	
		1	Enable
		0	Disable
	14	XRSTE : External Pin (PA7) Reset Enable	
		1	Enable
		0	Disable
	13~10	LVR : Low Voltage Reset Mode	
		1111	LV Reset 4.15V
		1110	LV Reset 4.01V
	
		0001	LV Reset 2.19V
		0000	LV Reset 2.05V
	9~8	WDTE : WDT Reset Enable	
		11	Always Enable
10		Enable in FAST/SLOW mode, Disable in IDLE/STOP mode	
	0X	Disable	
7~0	Reserved		

1.3 Page Lock Function

TM56F1543 support Page locker function. By setting LPROT (CFGWL.13), user can choose whether to turn it on. If the user A (library code provider) turns this function on, the user A (library code provider) can select different size (512~2304W) of lib protected area by LSZIE (CFGWL 12~9). In lib protected area, the user B (firmware developer) can't read ROM code by TABRL/TABRH instruction or in any other way. By using the TICE99IDE tool, the user A can provide a protected lib for the user B to use, but the user B does not know its details, and the user B still can continue to complete the main code in the unprotected area.

8K Program ROM

LSIZE	Lib Protected Area
2304	(1700H~1FFFH)
2176	(1780H~1FFFH)
2048	(1800H~1FFFH)
1920	(1880H~1FFFH)
1792	(1900H~1FFFH)
1664	(1980H~1FFFH)
1536	(1A00H~1FFFH)
1408	(1A80H~1FFFH)
1280	(1B00H~1FFFH)
1152	(1B80H~1FFFH)
1024	(1C00H~1FFFH)
896	(1C80H~1FFFH)
768	(1D00H~1FFFH)
640	(1D80H~1FFFH)
512	(1E00H~1FFFH)

1.4 EEPROM

The TM56F1543 contains 128 bytes of data EEPROM memory. It is organized as a separate data space, in which single bytes can be read and written. According the physical characteristic the EEPROM need more long access time than Program ROM. The EEPROM has an endurance of at least 10K write/erase cycle.

The EEPROM Read usage is same as use Table Read instruction except EEPROM enable bit must be set to high and DPH is always set to zero. By writing 0xE2 to register EEPEN (192h) can set the EEPROM enable bit, writing other value to EEPEN (192h) will clear the EEPROM enable bit.

◇Example: read EEPROM data @address 23h

```

MOVLW      E2h      ;
MOVWX      EEPEN    ; set EEPROM enable bit
CLR        DPH      ; set DPH=0 for EEPROM write/read
MOVLW      00h
MOVWX      DPH
MOVLW      23h
MOVWX      DPL      ; set DPTR=0023h
; read EEPROM @Address 23h data into W by using opcode TABRL
TABRL
....
; another way to read EEPROM data into W
MOVLW      01h      ;
MOVWX      TABR     ; TABR=01h=opcode TABRL
MOVXW      TABR     ; Read EEPROM data to W
...

```

The EEPROM Write usage is similar to read EEPROM except stop the Interrupt service. When F/W writes data to the register EEPDT (193h), the data will also be written to EEPROM. When the supply power (VCC) is bellow 3V, F/W must set **CPUPSC=2** to lower the system clock to avoid the EEP write error. Besides, F/W must clear WDT before EEPROM write if WDT is enabled.

◇Example: write EEPROM data A5h to address 23h

```

CLR        INTIE    ; disable INTIE
CLR        INTIE1   ; disable INTIE1
CLRWDTPR
MOVLW      E2h      ;
MOVWX      EEPEN    ; set EEPROM enable bit
CLR        DPH      ; set DPH=0 for EEPROM write/read
MOVLW      23h
MOVWX      DPL      ; set DPTR=0023h(set EEPROM Address)
MOVLW      00000010b
MOVWX      EEPCTL   ; set EEPROM write with 10mS time out
MOVLW      A5h
MOVWX      EEPDT    ; write data A5h EEPDT (193h)
; the data also save to EEPROM @Address 23h
BTXSC      EEPTO    ; check EEPROM write time-out flag
LGOTO      TIMEOUT
MOVXW      CLKCTL
ANDLW      FCh
IORLW      02h      ; If VCC is lower than 3V, F/W must set CPUPSC=2
MOVXW      CLKCTL   ; Fsys=FIRC/2 before write EEPROM
MOVLW      35h      ; write next EEPROM address 0x35
MOVWX      DPL      ; set DPTR=0035h
LCALL      WAIT100us ; If VCC is dropping and near LVR, it's necessary to wait
; 100us before continue to write next EEPROM address

```

MOVLW A5h
 MOVWX EEPDT ; write data A5h EEPDT (193h)
 ; the data also save to EEPROM @Address 35h

 CLRX EEPEN ; protect EEPROM from abnormal write

191h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EEPCTL	EEPTO	–	–	–	–	–	EEPTE	
R/W	R	–	–	–	–	–	R/W	R/W
Reset	0	–	–	–	–	–	0	0

191h.7 **EEPTO:** EEPROM Write Time-Out flag
 191h.1~0 **EEPTE:** Write Time-Out enable (Busy wait time)
 00:Disable 01: 2.5ms 10:10ms 11:20ms

192h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EEPEN	EEPEN							
R/W	W							
Reset	0							

192h.7~0 **EEPEN:** EEPROM Access Enable
 write 0xE2 to this register will enable EEPROM access
 write others value to this register will disable EEPROM access

193h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EEPDT	EEPDT							
R/W	W							
Reset	0							

193h.7~0 **EEPDT:** EEPROM Data to write
 write data to this register will let H/W write the data to EEPROM when EEPROM access is enable

107h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
LVRPD	LVRPD						PORPDF	LVRPDF
R/W	W						R/W	R/W
Reset	0							

107.7~0 **LVRPD:** LVR/POR power down register
 Write 0x37 to force LVR+POR be disabled (when read PORPDF=LVRPDF=1).
 Write 0x38 to force LVR be disabled, POR still enable (when read PORPDF=0, LVRPDF=1).
 Write 0x39 to force POR be disabled, LVR still enable (when read PORPDF=1, LVRPDF=0)
 Write other value to enable LVR+POR (when read PORPDF=LVRPDF=0)

18Ch	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TABR	TABR							
R/W	R/W							
Reset	0							

18C.7~0

1. TABR write 01h = opcode TABRL
2. TABR write 02h = opcode TABRH
3. After setp1 or step2, read TABR to get main ROM table read value
 After step1, read TABR to get EEPROM value (When EEPEN=E2h)

Table Read for ASM: instruction TABRL/TABRH or register TABR
Table Read for C : using register TABR

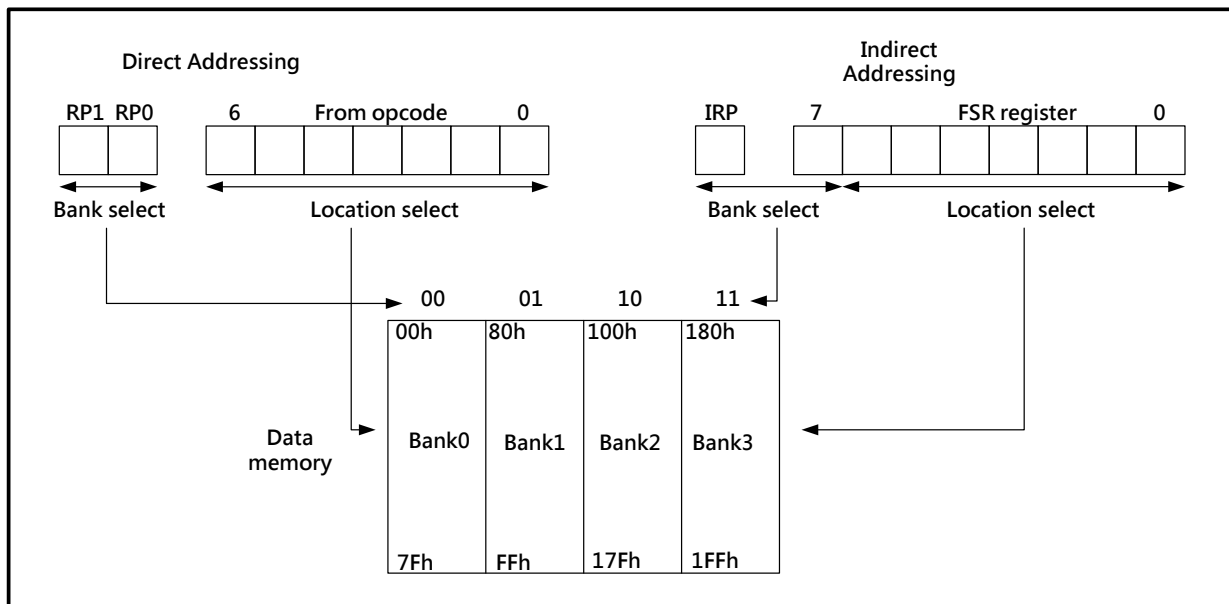

1.5 RAM Addressing Mode

The TM56F1543 has a 336-Byte Data Memory space and an additional 160-Byte Data Memory in CPU. The 336-Byte memory is partitioned into four banks memory plane. Each bank extends up to 7Fh (128 bytes). The lower locations of each bank are reserved for Special Function Register (SFR). Above the SFR are General Purpose Registers, implemented as static RAM. All implemented banks contain Special Function Registers. Some frequently used Special Function Registers from one bank may be mirrored in another bank for code reduction and quicker access.

Bit RP1 and RP0 (STATUS[6:5]) are the bank select bit for BANK 0/1/2/3

RP1 : RP0	BANK
00	0
01	1
10	2
11	3

The 336-Byte memory plane can be addressed directly or indirectly for BANK 0/1/2/3. The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing. Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses the register pointed to by the File Select Register, FSR. Reading the INDF register itself, indirectly (FSR = '0') will read 00h. Writing to the NDF register indirectly results in a no operation (although status bit may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>). Refer to the figure below.

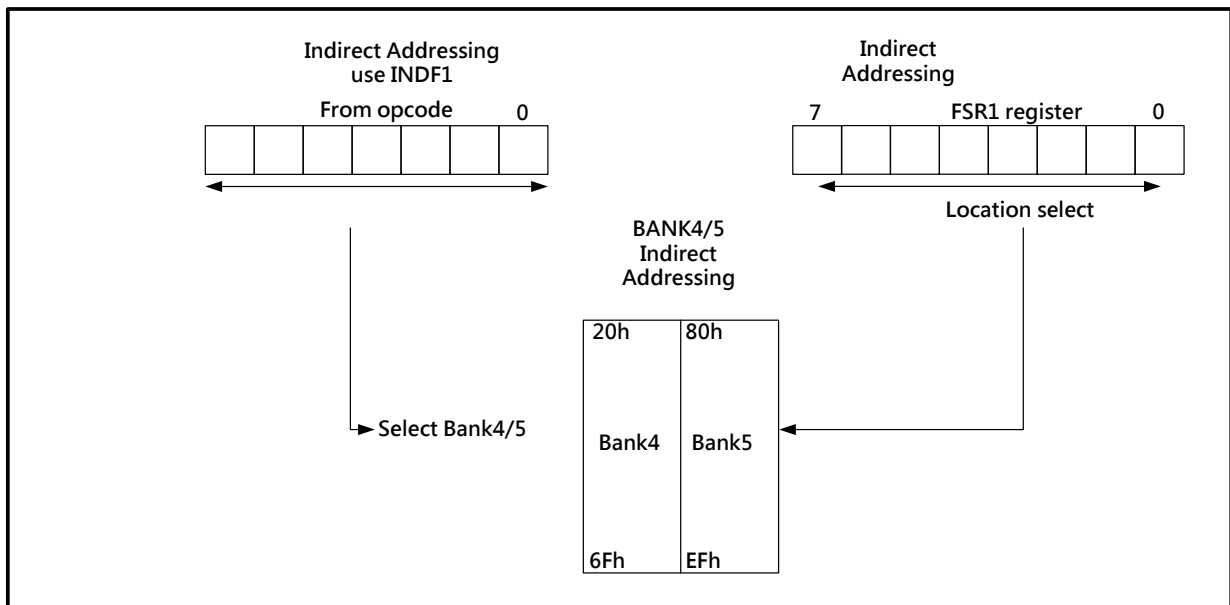

Direct / Indirect Addressing for BANK 0/1/2/3

Keeping RP0=RP1=0 in the beginning of the F/W code and using the new instruction set. The advantage of using new instruction is user can ignore the bank location of registers and the code size can be saved. The new instruction is almost same as the old instruction. By replacing the “F” to “X” in the instruction set can easily use the new instruction without switching the bank.

For example:

BCF	TM0IE	→	BCX	TM0IE
DECF	CNT, 1	→	DECX	CNT,1
INCFSZ	RAM25, 0	→	INCXSZ	RAM25, 0
MOVWF	PAMODL	→	MOVWX	PAMODL
RLF	RAMA0, 0	→	RLX	RAMA0, 0
SWAPF	ADCTL, 0	→	SWAPX	ADCTL, 0

There is an additional 160-Byte memory plane (BANK 4/5) which can only be accessed by using indirect addressing (using INDF1 and FSR1) to access this RAM space. INDF1 is used to select BANK 4/5 and FSR1 is used as the address pointer. For BANK4 the memory address is from 20H to 6FH and for BANK5 the memory address is from 80H to EFH.

Indirect Addressing for BANK 4/5

	BANK0 00~7Fh		BANK1 80h~FFh		BANK2 100h~17Fh		BANK3 180h~1FFh		BANK4 20~6Fh		BANK5 A0~EFh

FSR1 : **File Select Register1**, indirect address mode pointer
Used for BANK4/BANK5 memory only

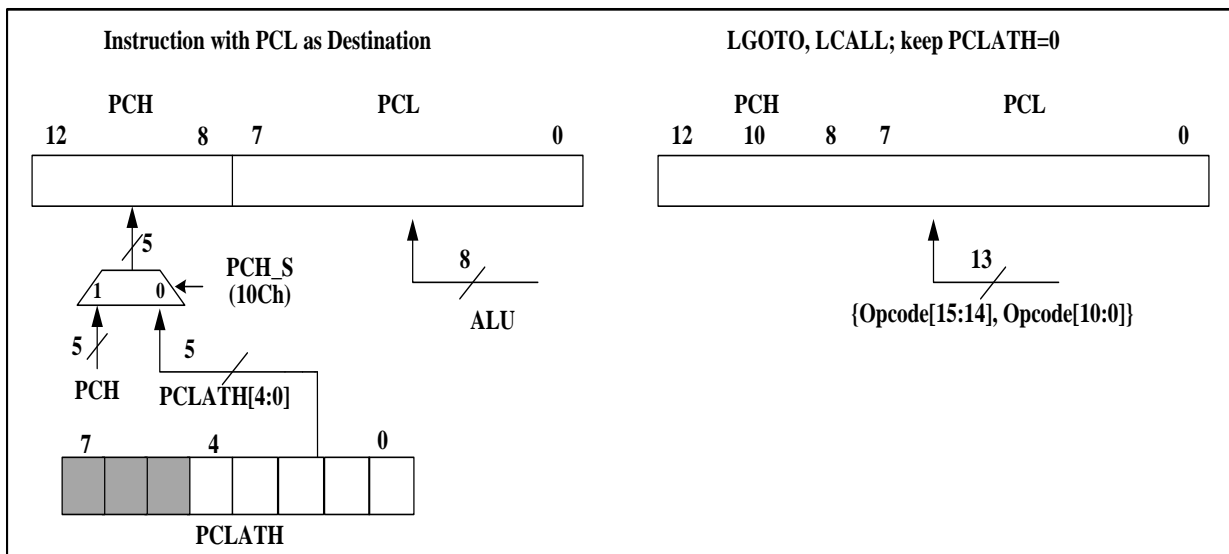

1.6 Programming Counter (PC) and Stack

The Programming Counter is 13-bit wide capable of addressing an 8K x 16 Flash ROM. The low byte comes from PCL register, which is readable and writable register. The upper bits (PC[12:8]) are not readable, but are indirectly writable through the PCLATH register or keeps unchanged when PCH_S is setting to “1”(by writing 1Ch to PCH_S register). On any RESET, the upper bits of the PC will be cleared. As a program instruction is executed, the PC will contain the address of the next program instruction to be executed. The PC value is normally increased by one except the followings. The Reset Vector (000h) and the Interrupt Vector (004h) are provided for PC initialization and Interrupt. For LCALL/LGOTO instruction, PC loads 13 bit address from instruction word. For RET/RETI/RETLW instruction, PC retrieves its content from the top level STACK.

When PCH_S is cleared to ‘0’ (by writing 0h to PCH_S register), executing any instruction with the PCL register as the destination simultaneously causes the Program Counter PC[12:8] bits (PCH) to be replaced by the contents of the PCLATH register . This allows the entire contents of the program counter to be changed by writing the desired upper 5 bits to the PCLATH register. When the lower 8 bits are written to the PCL register, all 13 bits of program counter will change to the values contained in the PCLATH register and those being written to the PCL register.

When PCH_S is setting to ‘1’, executing any instruction with the PCL register as the destination the lower 8 bits are written to the PCL register and will not change the Program Counter PC[12:8] bits (PCH).

For assembly code, **Setting PCH_S to “1” in the beginning of the F/W code and using new instruction LGOTO/LCALL (Hi-tech C doesn’t support the coding)**. The advantage of using new instruction is user can ignore setting PCLATH register, system will auto-read INST [15:14] directly from 8K ROM. The new instruction can easily use the new instruction without setting PCLATH

10Ch	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PCH_S	PCH_S							
R/W	R/W							
Reset	0	0	0	0	0	0	0	0

10Ch PCH_S: Program Counter Upper bits selection when instruction with PCL as destination is executed
 write 0x1C to set PCH_S= 1: PCH keep the original value
 write others to clear PCH_S=0: PCH is from PCLATH[4:0]

The STACK is 13-bit wide and 8-level in-depth. The LCALL instruction and hardware interrupt will push STACK level in order. While the RET/RETI/RETLW instruction pops STACK level in order.

For table lookup, the device offer the powerful table read instructions TABRL, TABRH to return the 16-bit ROM data into W register by setting DPTR={DPH, DPL} registers. It also offers another way to read the 16-bit ROM data into W register by setting TABR (18Ch) for C language.

◇ Example: To look up the PROM data located “TABLE1” and “TABLE2”.

```

ORG      00h          ; Reset Vector
LGOTO    START

1.7 ALU and Working (W) Register

The ALU is 8-bit wide and capable of addition, subtraction, shift and logical operations. In two-operand instructions, typically one operand is the W register, which is an 8-bit non-addressable register used for ALU operations. The other operand is either a file register or an immediate constant. In single operand instructions, the operand is either W register or a file register. Depending on the instruction executed, the ALU may affect the values of Carry (C), Digit Carry (DC), and Zero (Z) Flags in the STATUS register. The C and DC flags operate as a /Borrow and /Digit Borrow, respectively, in subtraction.

Note: /Borrow represents inverted of Borrow register.

/Digit Borrow represents inverted of Digit Borrow register

1.8 STATUS Register (03H/83H/103H/183H)

This register contains the arithmetic status of ALU and the Reset status. The STATUS register can be the destination for any instruction, as with any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. It is recommended, therefore, that only BCX, BSX and MOVWX instructions are used to alter the STATUS Register because these instructions do not affect those bits.

STATUS	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reset Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W
Bit	Description							
7	IRP: Register Bank Select bit (used for indirect addressing) 0 = Bank 0,1 (00h - FFh) 1 = Bank 2,3 (100h - 1FFh)							
6:5	RP1:RP0: Register Bank Select bits (used for direct addressing) 00 = Bank 0 (00h - 7Fh) 01 = Bank 1 (80h - FFh) 10 = Bank 2 (100h - 17Fh) 11 = Bank 3 (180h - 1FFh) Each bank is 128 bytes							
4	TO: Time Out Flag 0: after Power On Reset, LVR Reset or CLRWDT/SLEEP instruction 1: WDT time out occurs							
3	PD: Power Down Flag 0: after Power On Reset, LVR Reset or CLRWDT instruction 1: after SLEEP instruction							
2	Z: Zero Flag 0: the result of a logic operation is not zero 1: the result of a logic operation is zero							
1	DC: Decimal Carry Flag or Decimal / Borrow Flag							
	ADD instruction				SUB instruction			
	0: no carry 1: a carry from the low nibble bits of the result occurs				0: a borrow from the low nibble bits of the result occurs 1: no borrow			
0	C: Carry Flag or /Borrow Flag							
	ADD instruction				SUB instruction			
	0: no carry 1: a carry occurs from the MSB				0: a borrow occurs from the MSB 1: no borrow			

- ◇ Example: Write immediate data into STATUS register.

```
MOVLW 00h
MOVWX STATUS ; Clear STATUS register
```

- ◇ Example: Bit addressing set and clear STATUS register.

```
BSX STATUS, 0 ; Set C=1.
BCX STATUS, 0 ; Clear C=0.
```

- ◇ Example: Determine the C flag by BTXSS instruction.

```
BTXSS STATUS, 0 ; Check the carry flag
LGOTO LABEL_1 ; If C=0, goto label_1
LGOTO LABEL_2 ; If C=1, goto label_2
```

2. Reset

This device can be RESET in four ways.

- Power-On-Reset (POR)
- Low Voltage Reset (LVR)
- External Pin Reset (PA7)
- Watchdog Reset (WDT)

Resets can be caused by Power on Reset (POR), External Pin Reset (XRST), Watchdog Timer Reset (WDTR) , or Low Voltage Reset (LVR) . The CFGWH controls the Reset functionality. After Reset, the SFRs are returned to their default value, the program counter (PC) is cleared, and the system starts running from the reset vector 000H place. The TO and PD flags at status register (STATUS) are indicate system reset status.

2.1 Power on Reset

After Power-On-Reset, all system and peripheral control registers are then set to their default hardware Reset values. The clock source, LVR level and chip operation mode are selected by the SYSCFG register value.

2.2 Low Voltage Reset

The chip provides Low Voltage Reset (LVR) and Low Voltage Detection (LVD) functions. There are 16-level LVR can be selected by CFGWH and 16-level LVD can be selected by SFR LVDS

SYSCFG 01h	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8
CFGWH	PROT	XRSTE	LVRE				WDTE	

CFGWH.13~10 LVRE: Low Voltage Reset function select

- 0000: Set LVR at 2.05V
- 0001: Set LVR at 2.19V
- 0010: Set LVR at 2.33V
- 0011: Set LVR at 2.47V
- 0100: Set LVR at 2.62V
- 0101: Set LVR at 2.75V
- 0110: Set LVR at 2.89V
- 0111: Set LVR at 3.03V
- 1000: Set LVR at 3.17V
- 1001: Set LVR at 3.31V
- 1010: Set LVR at 3.45V
- 1011: Set LVR at 3.59V
- 1100: Set LVR at 3.73V
- 1101: Set LVR at 3.87V
- 1110: Set LVR at 4.01V
- 1111: Set LVR at 4.15V

16h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
LVCTL	LVDF	-	LVRSAV	LVDSAV	LVDS			
R/W	R	-	R/W	R/W	R/W	R/W	R/W	R/W

- 16h.7 **LVDF:** Low Voltage Detect output Flag
- 16h.5 **LVRSAV:** when set to 1, LVR auto power off in STOP/IDLE mode
- 16h.4 **LVDSAV:** when set to 1, LVD auto power off in STOP/IDLE mode
- 16h.3~0 **LVDS:** Low Voltage Detect select
 - 0000: Disable LVD
 - 0001: Set LVD at 2.19V
 - 0010: Set LVD at 2.33V
 - 0011: Set LVD at 2.47V
 - 0100: Set LVD at 2.62V
 - 0101: Set LVD at 2.75V
 - 0110: Set LVD at 2.89V
 - 0111: Set LVD at 3.03V
 - 1000: Set LVD at 3.17V
 - 1001: Set LVD at 3.31V
 - 1010: Set LVD at 3.45V
 - 1011: Set LVD at 3.59V
 - 1100: Set LVD at 3.73V
 - 1101: Set LVD at 3.87V
 - 1110: Set LVD at 4.01V
 - 1111: Set LVD at 4.15V

Different Fsys have different system minimum operating voltage, reference to Operating Voltage of DC characteristics, if current system voltage is low than minimum operating voltage and lower LVR is selected, then the system maybe enters dead-band and error occurs.

2.3 External Pin Reset

The External Pin Reset can be disabled or enabled by the SYSCFG register (XRSTE). It needs to keep at least 2 SIRC clock cycle long to be seen by the chip. External Pin Reset also set all the control registers to their default reset value. The TO/PD flags are not affected by these resets.

External reset pin is low level active. The system is running when reset pin is high level voltage input. The reset pin receives the low voltage and the system is reset. The external reset can reset the system during power on duration and good external reset circuit can protect the system to avoid operating at inappropriate power condition.

SYSCFG 01h	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8
CFGWH	PROT	XRSTE	LVRE			WDTE		

- CFGWH.14 XRSTE:** External Pin Reset control
 - 0: Disable External Pin Reset
 - 1: Enable External Pin Reset

2.4 Watchdog Timer Reset

WDT overflow Reset can be disabled or enabled by the SYSCFG register. It runs in Fast/Slow mode and runs or stops in IDLE/STOP mode. WDT overflow speed can be defined by WDT_PSC SFR. WDT is cleared by device Reset or CLRWDT SFR bit WDT overflow Reset also set all the control registers to their default reset value. The TO/PD flags are not affected by these resets.

...
LGOTO  START
```

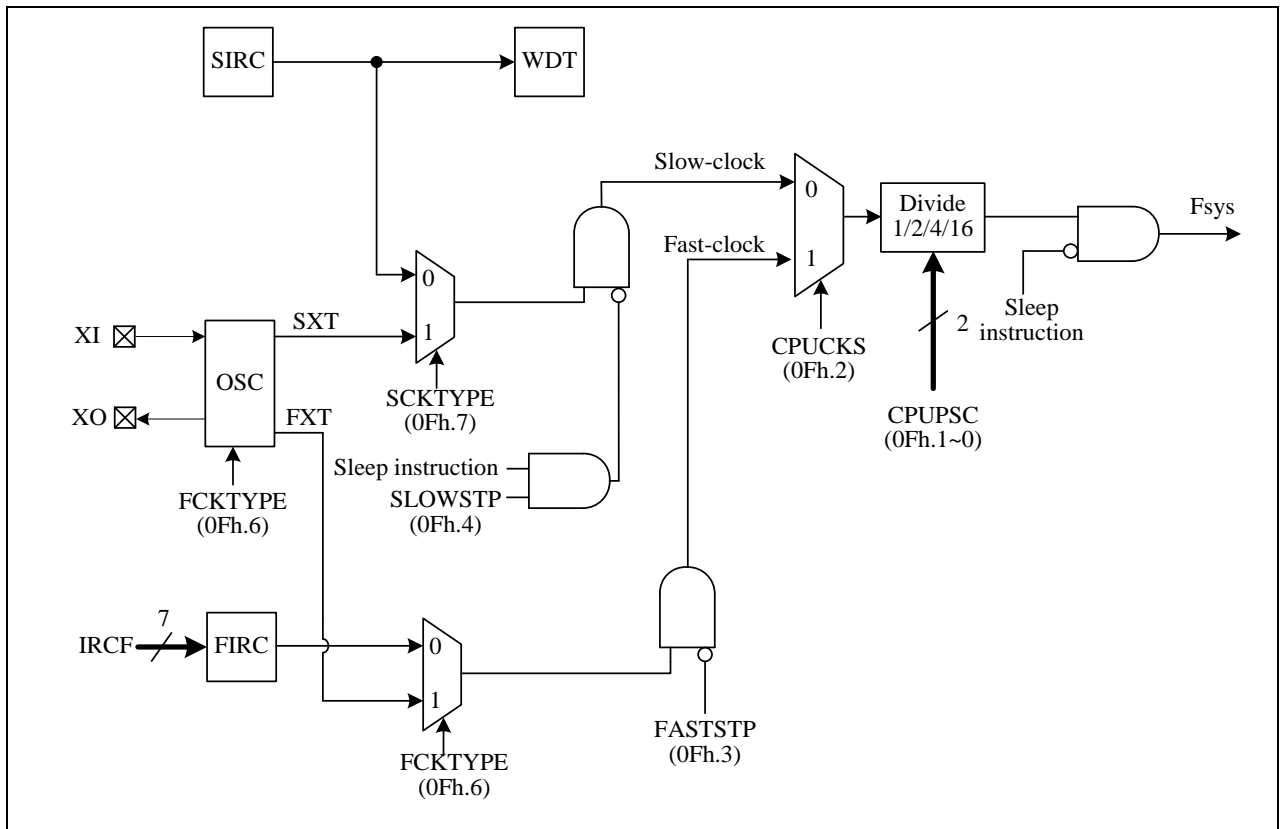

3. Clock Circuitry and Operation Mode

3.1 System Clock

The device is designed with dual-clock system. There are two kinds of clock source, i.e. Slow clock or fast clock. The Slow clock can be selected as SIRC (Slow Internal RC) or SXT (Slow Crystal, 32KHz). The Fast clock can be selected as FIRC (Fast Internal RC) or FXT (Fast Crystal 18MHz). Each clock source can be applied to CPU kernel as system clock. When in IDLE mode, only Slow-clock can be configured to keep oscillating to provide clock source to T2 block. Refer to the figure below.

After Reset, the device is running at Slow mode with 50 KHz SIRC. S/W should select the proper clock rate for chip operation safety. The higher V_{CC} allows the chip to run at a higher System clock frequency. In a typical condition, an 18.432 MHz System clock rate requires $V_{CC} > 2.8V$.

The CLKCTL SFR controls the System clock operating. H/W automatically blocks the S/W abnormally setting for this register. S/W can only change the Slow-clock type in Fast mode and change the Fast-clock type in Slow mode. Never to write both FASTSTP=1 & CPUCKS=1. It is recommended to write this SFR bit by bit.

Clock Scheme Block Diagram

The frequency of FIRC (Fast Internal RC) can be adjusted by IRCF and IRCF is trimmed to FIRC=18.432 MHz in chip manufacturing

0Fh	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CLKCTL	SCKTYPE	FCKTYPE	–	SLOWSTP	FASTSTP	CPUCKS	CPUPSC

1: Fast Clock as system clock

0Fh.1~0 **CPUPSC:** System clock Prescaler

0: div 8

1: div 4

2: div 2

3: div 1

FAST Mode:

In this mode, the program is executed using Fast-clock as CPU clock (Fsys). The Timer0 block is driven by Fast-clock or SXT/16. The Timer1 block is also driven by Fast-clock; The PWMx blocks can be driven by FIRC, FIRC*2 or Fsys. T2 can be driven by Slow-clock or Fsys/128 by setting T2CKS (15h.2).

SLOW Mode:

After power-on or reset, device enters SLOW mode, the default Slow-clock is SIRC. In this mode, the Fast-clock can stopped (by FASTSTP=1, for power saving) or running (by FASTSTP=0), and Slow-clock is enabled. All peripheral blocks (Timer0, Timer1etc...) clock sources are Slow-clock in the SLOW mode.

IDLE Mode:

If Slow-clock is enabled (SLOWSTP=0) and T2CKS=0 before executing the SLEEP instruction, the CPU enters the IDLE mode. In this mode, the Slow-clock source keeps T2 block running. CPU stop fetching code and all blocks are stop except T2 related circuits. Idle mode is terminated by Reset or enabled Interrupts wake up.

Another way to keep clock oscillation in IDLE mode is setting WKTIE=1 before executing the SLEEP instruction. In such condition, the WKT keeps working and wake up CPU periodically.

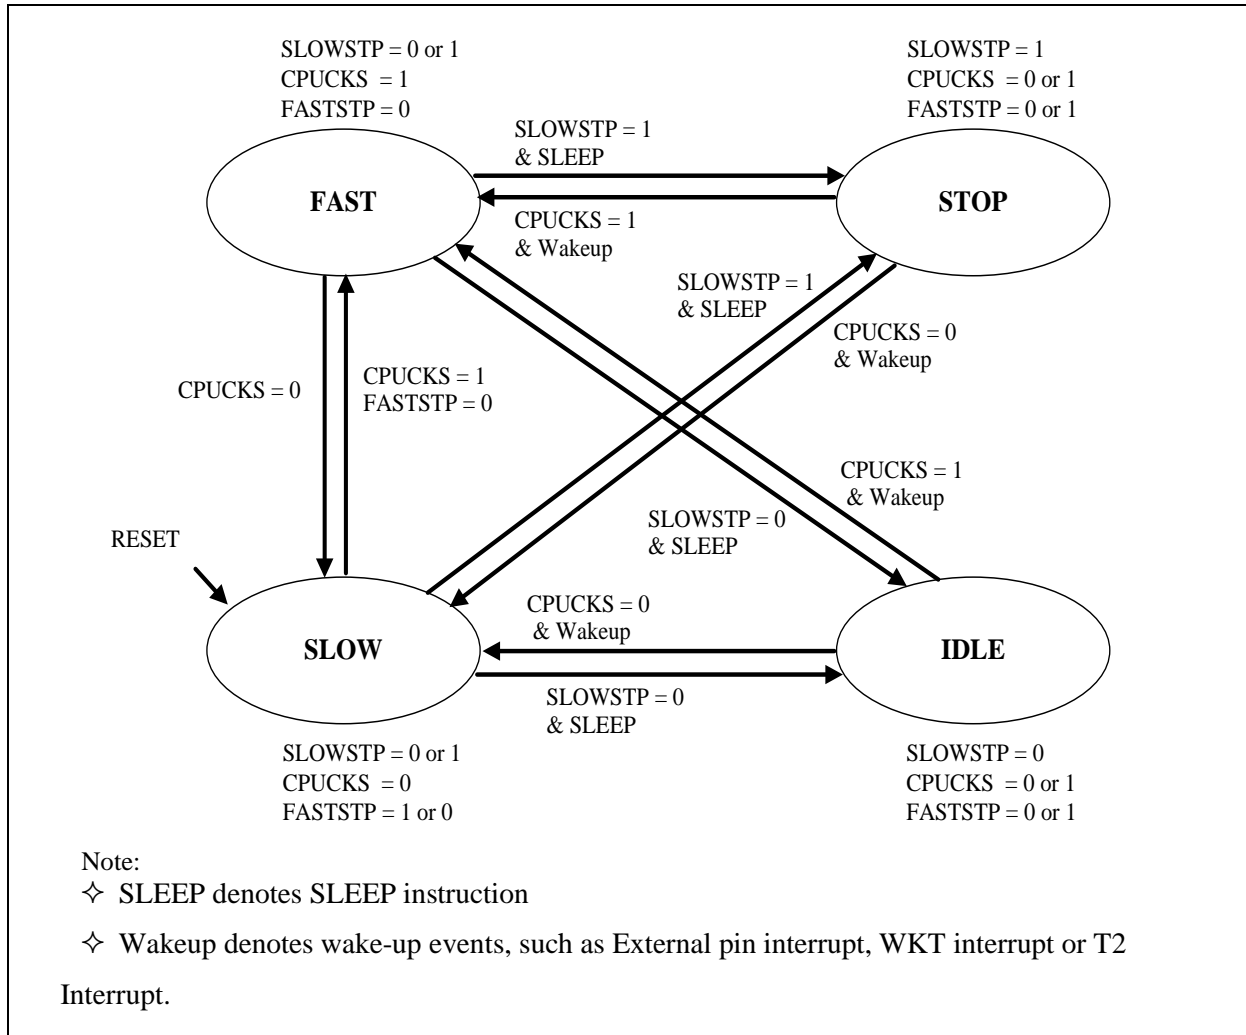

T2 and WKT/WDT are independent and have their own control registers. It is possible to keep both T2 and WKT working and wake-up in the IDLE mode.

STOP Mode:

If Slow-clock and WKT/WDT are disabled before executing the SLEEP instruction, every block is turned off and the device enters the STOP mode. STOP mode is similar to IDLE mode. The difference is all clock oscillators either Fast-clock or Slow-clock is power down and no clock is generated.

3.2 Dual System Clock Modes Transition

The device is operated in one of four modes: FAST mode, SLOW mode, IDLE mode, and STOP mode.

CPU Operation Block Diagram

CPU Mode & Clock Functions Table:

Mode	Oscillator	Fsys	Fast-clock	Slow-clock	TM0/TM1	T2	Wakeup event
FAST	FIRC, FXT	Fast-clock	Run	Set by SLOWSTP	Run	Run	X
SLOW	SIRC, SXT	Slow-clock	Set by FASTSTP	Run	Run	Run	X
IDLE	SIRC, SXT	Stop	Stop	Run	Stop	Run	WKT/IO/T2
STOP	Stop	Stop	Stop	Stop	Stop	Stop	IO

● **FAST mode switches to SLOW mode**

The following steps are suggested to be executed by order when FAST mode switches to SLOW mode:

- (1) Enable Slow-clock (SLOWSTP=0)
- (2) Switch to Slow-clock (CPUCKS=0)
- (3) Stop Fast-clock (FASTSTP=1)

◇ Example: Switch FAST mode to SLOW mode.

```
BCX    SLOWSTP    ; Enable Slow-clock.
NOP
BCX    CPUCKS    ; Fsys=Slow-clock.
BSX    FASTSTP   ; Disable Fast-clock.
```

● **SLOW mode switches to FAST mode**

SLOW mode can be enabled by CPUCKS=0 in CLKCTL register. The following steps are suggested to be executed by order when SLOW mode switches to FAST mode:

- (1) Enable Fast-clock (FASTSTP=0)
- (2) Switch to Fast-clock (CPUCKS=1)

◇ Example: Switch SLOW mode to FAST mode (The Fast-clock stop).

```
BCX    FASTSTP   ; Enable Fast-clock.
NOP
BSX    CPUCKS    ; Fsys=Fast-clock
```

● **IDLE mode Setting**

The IDLE mode can be configured by following setting in order:

- (1) Enable Slow-clock (SLOWSTP=0) or WKT(WKTIE=1)
- (2) Switch T2 clock source to Slow-clock (T2CKS=0)
- (3) Execute SLEEP instruction

IDLE mode can be wakened up by External interrupt, WKT interrupt and T2 interrupt.

◇ Example: Switch FAST/SLOW mode to IDLE mode.

```
BCX    SLOWSTP   ; Enable Slow-clock.
MOVLW 0000000B
MOVWX  T2CTL     ; T2 Clock source=Slow-clock. T2PSC=div 32768
SLEEP                               ; Enter IDLE mode.
```

STOP Mode Setting

The STOP mode can be configured by following setting in order:

- (1) Stop Slow-clock (SLOWSTP=1)
- (2) Stop WKT/WDT (WKTIE=0, WDTE=10 or 0X)
- (3) Execute SLEEP instruction

STOP mode can be wakened up only by External pin interrupt or Pin Change.

◇ Example: Switch FAST/SLOW mode to STOP mode.

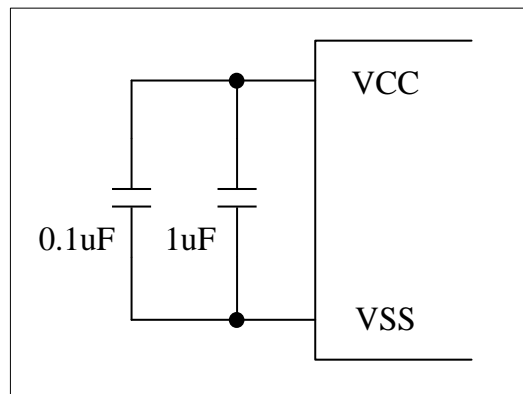

```
BSX      SLOWSTP    ; Disable Slow-clock.  
MOVLW   00000000B ; Disable WKT counting  
MOVW    INTIE  
SLEEP
```

3.3 System Clock Oscillator

System clock can be operated in four different oscillation modes. Four oscillation modes are FIRC, FXT, SIRC and SXT respectively. In the Fast Internal RC (FIRC) mode, the on-chip oscillator generates 18.432 MHz system clock. In Slow/Fast Crystal (SXT/FXT) mode, a crystal or ceramic resonator is connected to XI and XO pins to establish oscillation. Since power noise degrades the performance of Internal Clock Oscillator, placing power supply bypass capacitors 1uF and 0.1uF very close to VCC/VSS pins improves the stability of clock and the overall system.

**External Oscillator Circuit
(Crystal or Ceramic)**

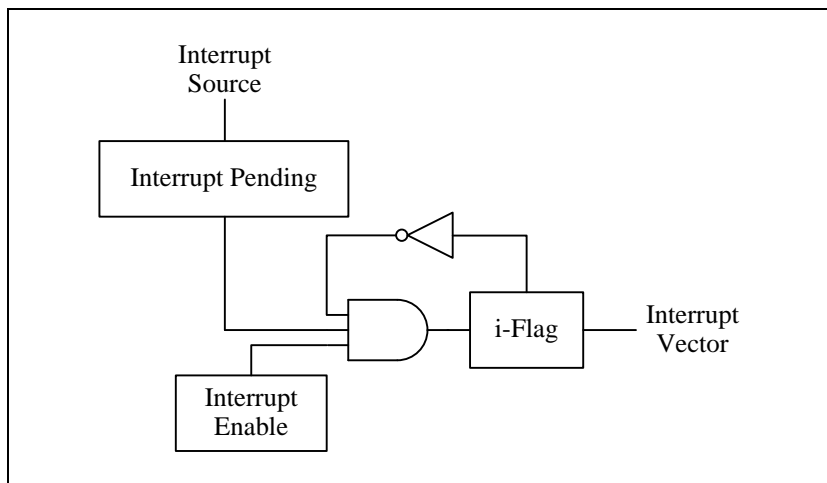

Internal RC Mode

4. Interrupt

TM56F1543 has 1 level, 1 vector and 13 interrupt sources. Each interrupt source has its own enable control bit. An interrupt event will set its individual pending flag; no matter its enable control bit is 0 or 1.

If the corresponding interrupt enable bit (INTIE[7:0] or INTIE1[7:0]) has been set, it would trigger CPU to service the interrupt. CPU accepts interrupt in the end of current executed instruction cycle. In the mean while, a “LCALL 004” instruction is inserted to CPU, and i-Flag is set to prevent recursive interrupt nesting.

The i-Flag is cleared in the instruction after the “RETI” instruction. That is, at least one instruction in main program is executed before service the pending interrupt. The interrupt event is level triggered. F/W must clear the interrupt event register while serving the interrupt routine.

◇ Example: Setup INT1 (PA4) interrupt request with rising edge trigger.

```

ORG      00h          ; Reset Vector
LGOTO    START       ; Goto user program address

ORG      004h        ; All interrupt vector
LGOTO    INT         ; If INT1 (PA4) input occurred rising edge

ORG      100h

START:
MOVLW   xxxxxx00B
MOVW    PAMODH      ; select INT1 Pin Mode as Mode0

MOVLW   xxx1xxxxB
MOVW    PAD         ; Release INT1, it becomes Schmitt-trigger
                          ; input with pull-up resistor

MOVLW   xx1xxxxxB
MOVW    OPTION      ; Set INT1 interrupt trigger as rising edge

MOVLW   1111101B
MOVW    INTIF       ; Clear INT1 interrupt request flag

MOVLW   00000010B
MOVW    INTIE       ; Enable INT1 interrupt

MAIN:

```

```

....
LGOTO      MAIN
INT:
MOVWX     RAM20h      ; Store W data to RAM 20h

This bit is set by H/W while data receiving to I2CRCD0 finished, write 0 to this bit will clear this flag

5. I/O Port

5.1 PA0-4, PA7, PB0-7, PC0-3 and PD0-7

These pins can be used as Schmitt-trigger input, CMOS push-pull output. The pull-up resistor is assignable to each pin by S/W setting. To use the pin in Schmitt-trigger input mode, S/W needs to set the I/O pin to Mode0 or Mode1 and PxD=1 (x=A, B, C or D). Reading the pin data (PxD) has different meaning. In “Read-Modify-Write” instruction, CPU actually reads the output data register. In the others instructions, CPU reads the pin state. The so-called “Read-Modify-Write” instruction includes BSX, BCX and all instructions.

These pins can operate in four different modes as below.

Mode	PA0~PA4, PB, PC, PD pin function	PxD SFR data	Pin State	Resistor Pull-up	Digital Input
Mode 0	Open Drain	0	Drive Low	N	N
	Input	1	Pull-up	Y	Y
Mode 1	Open Drain	0	Drive Low	N	N
		1	Hi-Z	N	Y
Mode 2	CMOS Output	0	Drive Low	N	N
		1	Drive High	N	N
	Touch Key	0	TK	N	N
Mode 3	ADC	X (don't care)	—	N	N

I/O Pin Function Table

The chip support I/O Pin Current control (High-Sink/LED Current Control). For efficient control, we divided the High-sink pin or LED Pins into four groups (PA, PB, PC and PD group) independently. It is enable by setting IOCCTRL register.

1Bh	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IOCCTRL	LED				HSNK			
R/W	R/W				R/W			
Reset	0	0	0	0	0	0	0	0

5.2 Pin Interrupt

Pin interrupts include INT0, INT1, INT2 and PA0-4, PA7, PB0-7, PC0-3 and PD0-7 Change Interrupt. These pins also have the STOP mode wake up capability. INT0 and INT1 are falling edge or rising edge triggered, INT2 is falling edge triggered. All of the IO pins Change Interrupt is triggered by any pin state change when the pin wakeup register PxWKE (x=A, B, C or D) and Pin Change Interrupt Enable bit (PXIE) is set to enable the function.

- ◇ Example: Setup Port B as Pin Change interrupts.

ORG	00h	; Reset Vector
LGOTO	START	; Goto user program address

```

    ORG      004h      ; All interrupt vector
    LGOTO    INT      ; If PXINT (PB) pin change occurred

    ORG      100h
START:

6. Peripheral Functional Block

6.1 Watchdog (WDT) /Wakeup (WKT) Timer

The WDT and WKT share the same built-in internal RC Oscillator and have individual own counters. The overflow period of WDT, WKT can be selected by individual prescaler (WDT_PSC [1:0], WKT_PSC [1:0]). The WDT timer is cleared by the CLRWDT instruction. If the Watchdog is enabled (CFGWH.9=WDTE=1), the WDT generates the chip reset signal. Set CFGWH.8 to '0' can let WDT timer stop counting after executing SLEEP instruction, i.e. CFGWH.8=1 WDT timer is always keep counting even if the SLEEP instruction is executed.

The WKT timer is an interval timer, WKT time out will generate WKT Interrupt Flag (WKTIF). The WKT timer is cleared/stopped by WKTIE=0. Set WKTIE=1, the WKT timer will always count regardless at any CPU operating mode.

WDT/WKT Block Diagram

Watchdog clear is controlled by CLRWDT instruction and moving any value into WDTCLR is to clear watchdog timer.

- ◇ Example: Clear watchdog timer by CLRWDT instruction.

MAIN:

```

...                               ; Execute program.
CLRWDT                             ; Execute CLRWDT instruction.
...
GOTO    MAIN

```

- ◇ Example: Setup WDT time and disable after executing SLEEP instruction.

```

MOVLW  00000111B
MOVWX  OPTION      ; Select WDT Time out=328 ms @5V

SLEEP

```

- ◇ Example: Set WKT period and interrupt function.

```

MOVLW  00000110B

 00: 21ms 01: 41 ms 10: 82 ms 11: 164 ms

6.2 Timer0

The Timer0 is an 8-bit wide register 01h (TM0). It can be read or written as any other register. Besides, Timer0 increases itself periodically and automatically rolls over a new "offset value" (TMORLD) while it rolls over based on the pre-scaled clock source, which can be $F_{sys}/2$ when $TM0CKS=0$ or $TM0CKI$ (PA2) rising/falling input when $TM0CKS=1$ and $TOISRC=0$ or $SXT/16$ when $TM0CKS=1$ and $TOISRC=1$. The Timer0 increase rate is determined by "Timer0 Pre-Scale" (TM0PSC) register. The Timer0 always generates $TM0IF$ when its count rolls over. It generates Timer0 Interrupt if ($TM0IE$) is set. Timer0 can be stopped counting if the $TM0STP$ bit is set.

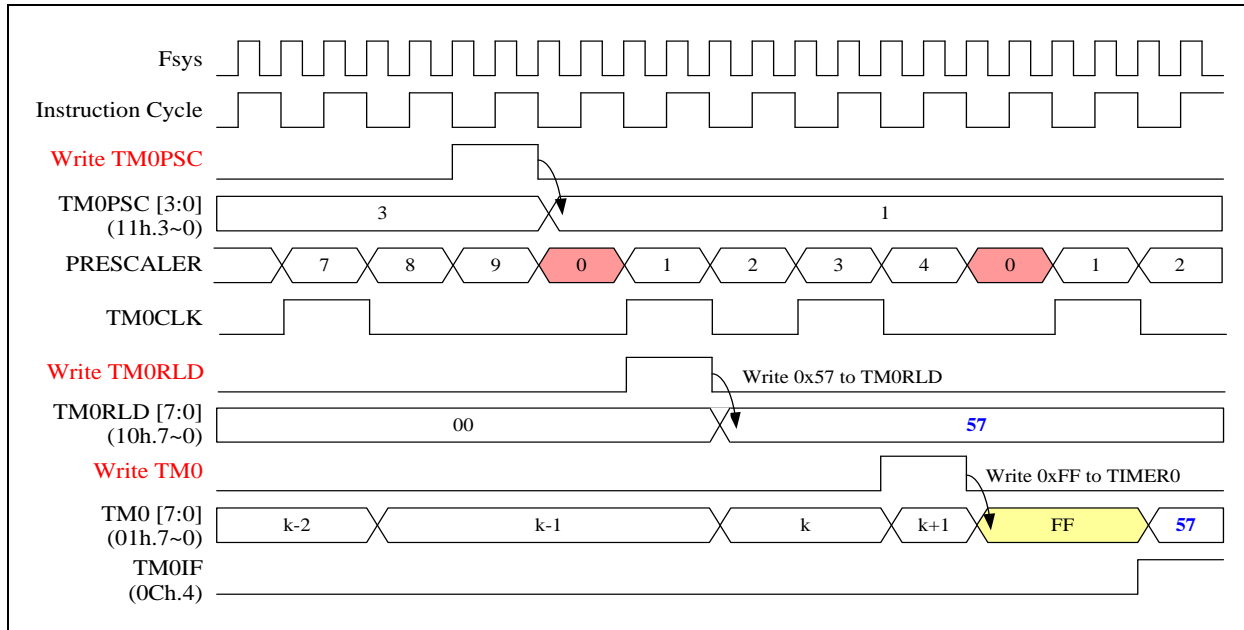

Timer0 Block Diagram

	Timer Mode	Counter Mode TM0CKI(PA2)	Counter Mode SXT/16
TM0CKS	0	1	1
TOISRC	x	0	1

Timer0 Mode Control Signal Table

The following timing diagram describes the Timer0 works in pure Timer mode.

When the Timer0 prescaler (TM0PSC) is written, the internal 8-bit prescaler will be cleared to 0 to make the counting period correct at the first Timer0 count. $TM0CLK$ is the internal signal that causes the Timer0 to increase by 1 at the end of $TM0CLK$. $TM0WR$ is also the internal signal that indicates the Timer0 is directly written by instruction; meanwhile, the internal 8-bit prescaler will be cleared. When Timer0 counts from FFh to $TMORLD$, $TM0IF$ (Timer0 Interrupt Flag) will be set to 1 and generate interrupt if $TM0IE$ (Timer0 Interrupt Enable) is set.

Timer0 works in Timer mode (TM0CKS=0)

The equation of TM0 interrupt time value is as following:

$$\text{TM0 interrupt interval cycle time} = F_{sys}/2/\text{TM0PSC}/(256-\text{TM0})$$

◇ Example: Setup TM0 work in Timer mode

; Setup TM0 clock source and divider

```
MOVLW 00000101B ; TM0CKS=0, Setup TM0 clock= Fsys/2
MOVWX TM0CTL ; TM0PSC=5, TM0PSC= Fsys/64
```

; Set TM0 timer.

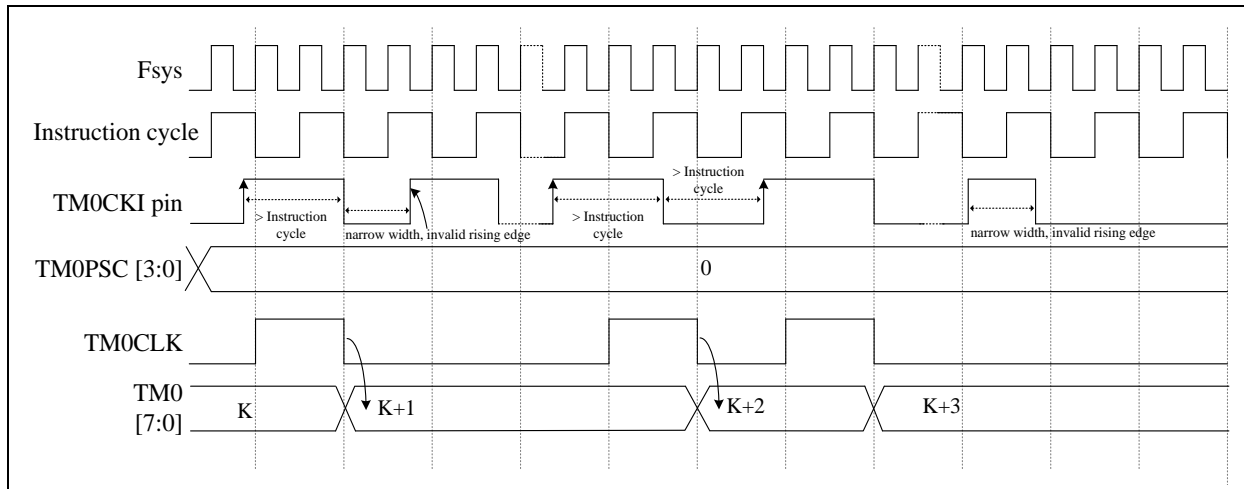

```
BSX TM0STP ; Disable TM0 counting (Default "0").
MOVLW 156
MOVWX TM0 ; Write 156 into TM0 register
MOVLW 124
MOVWX TM0RLD ; Write 156 into TM0RLD register
```

; Enable TM0 timer and interrupt function.

```
MOVLW 11101111B ; Clear TM0 request interrupt flag by byte operation
MOVWX INTIF ; 0Ch
MOVLW 00010000B ; Enable TM0 interrupt function
MOVWX INTIE ; 0Bh
BCX TM0STP ; Enable TM0 counting (Default "0").
```

The following timing diagram describes the Timer0 works in Counter mode.

If TM0CKS=1 then Timer0 counter source clock is from TM0CKI pin. TM0CKI signal is synchronized by instruction cycle ($F_{sys}/2$) that means the high/low time durations of TM0CKI must be longer than one instruction cycle time ($F_{sys}/2$) to guarantee each TM0CKI's change will be detected correctly by the synchronizer.

Timer0 works in Counter mode for TM0CKI (TM0EDG=0) , TM0CKS=1

- ◇ Example: Setup TM0 work in Counter mode and clock source from TM0CKI pin (PA2)
 - ; Setup TM0 clock source from TM0CKI pin (PA2) and divider.

```

MOV LW 00110000B
MOV WX TM0CTL ; TM0EDG=1
; Select TM0 prescaler counting edge=falling edge.
; TM0CKS=1, Setup TM0 clock=TM0CKI pin (PA2)
; TM0PSC=0
; TM0 clock prescaler= TM0CKI divided by 1

```
 - ; Set TM0 timer and stop TM0 counting.

```

BSX TM0STP ; Disable TM0 counting (Default "0").
MOV LW 00H
MOV WX TM0 ; Write 0 into TM0 register 01H.

```
 - ; Start TM0 count and read TM0 counter.

```

BCX TM0STP ; Enable TM0 counting.
NOP
NOP
NOP
BSX TM0STP ; Disable TM0 counting (Default "0")

MOVXW TM0

```

6.3 Timer1

The Timer1 is an 8-bit wide register. It can be read or written as any other register. Besides, Timer1 increases itself periodically and automatically reloads a new "offset value" (TM1RLD) while it rolls over based on the pre-scaled instruction clock ($F_{sys}/2$). The Timer1 increase rate is determined by TM1PSC register. Set the TM1STP bit will stop Timer1 counting. TM1OUT is an output signal that toggles when Timer1 overflow.

Timer1 Block Diagram

Timer1 Timing Diagram

Timer1 Reload Diagram

- ◇ Example: Setup TM1 work in Timer mode and counting overflow toggle out to TM1OUT (PB0) configuration.

; Setup TM1 clock source, divider and enable TM1OUT

```
MOVLW 00000101B
MOVWX TM1CTL ; TM1PSC=5 , Select TM1 clock=Fsys/64.
BSX TM1OE ; Enable TM1OUT function pin (PB0).
```

; Set TM1 timer offset and stops TM1 counting

```
BSX TM1STP ; Stop TM1 counting (Default "0").
MOVLW F0H
MOVWX TM1 ; Write F0H into TM1 counter
```

; Enable TM1 timer and interrupt function.

```
MOVLW 11011111B ; Clear TM1 request interrupt flag by byte operation
MOVWX INTIF ; 09H
```

```
MOVLW 00100000B ; Enable TM1 interrupt function.
MOVWX INTIE ;
```

```
BCX TM1STP ; Enable TM1 counting (Default "0").
```

Example:

Fsys=4 MHz, TM1PSC=1, TM1 clock source=Fsys/4=1 MHz

TM1RLD=0xF0,

TM1 interrupt time= (1/1 MHz) * (0xFF – 0xF0) =1 us*16=16 us

TM1OUT output time period=16 us *2=32 us.

TM1OUT output frequency=1/32 us=31.250 KHz.

6.4 T2:15-bit Timer

The T2 is a 15-bit counter and the clock sources are from either $F_{sys}/128$ or Slow-clock. It is used to generate time base interrupt and T2 counter block clock. The T2 content cannot be read by instructions. It generates interrupt flag T2IF (0Ch.6) with the clock divided by 32768/16384/8192/128 depends on T2PSC[1:0] (15h.1~0) register bits. The following figure shows the block diagram of T2.

T2 Block Diagram

Example:

[CPU running at FAST mode, F_{sys} =Fast-clock= FIRC/4= 4.6 MHz]

◇ Example:

; Setup T2 clock source and divider .

```

MOVLW 00001101B ;15h.3 (T2CLR)=1, Stop T2 counting
MOVWX T2CTL      ;15h.2 (T2CKS) = 1, T2 clock source = Fsys/128
◇              ;15h.1~0 (T2PSC) =1, Divided by 16384
    
```

; Enable T2 timer and interrupt function.

```

MOVLW 10111111B ; Clear T2 request interrupt flag by byte operation
MOVWX INTIF      ;
    
```

```

MOVLW 01000000B ; Enable T2 interrupt function.
MOVWX INTIE      ;
    
```

```

BCX    T2CLR      ; (T2CLR)=0, Enable T2 counting (Default "0").
    
```

T2 clock source is $F_{sys}/128 = 4.6 \text{ MHz}/128 = 36000 \text{ Hz}$, T2PSC = /16384

T2 frequency = $36000 \text{ Hz} / 16384 \approx 2.197 \text{ Hz}$

◇ Example:

[CPU running at SLOW mode, F_{sys} = Slow-clock = SIRC= 50KHz]

◇ Example:

; Setup T2 clock source and divider

```
MOVLW 00001000B ; 15h.3 (T2CLR)=1, Stop T2 counting
MOVWX T2CTL      ; 15h.2 (T2CKS) = 0, T2 clock source = Slow-clock
                ; 15.1~0 (T2PSC) =0, Divided by 32768
```

; Enable T2 timer and interrupt function.

```
MOVLW 10111111B ; Clear T2 request interrupt flag
MOVWX INTIF
```

```
MOVLW 01000000B ; Enable T2 interrupt function.
MOVWX INTIE
```

```
BCX    T2CLR      ; (T2CLR)=0, Enable T2 counting (Default "0").
```

T2 clock source is Slow-clock = 50KHz, T2PSC = /32768,

T2 frequency = 50000Hz / 32768 ≈ 1.53Hz

6.5 PWM: Six 16-bit PWM Module

This Chip has six 16-bit PWM modules, PWM0 to PWM5. PWM0~PWM5 have independent 16-bit duty control register, and share a set of 16-bit period register. The PWM can generate various frequency waveforms with 65536 duty resolution based on PWMCLK, which frequency can select Fsys or FIRC OR FIRC*2, decided by PWMCKS (8Fh.5~4).

The 16-bit PWM period PWMPRD and PWM duty PWM0D~PWM5D registers all have a low and high byte structure. **Writing to these register pairs must be carried out in a specific way. That is, write low byte register first and then writes high byte register.** For example, writing period value to PWMPRDL register (93h) and then PWMPRDH (92h). The PWMPRD will immediately change to the new values when high byte data has been written to the register. Writing PWM0D~PWM5D are the same as writing PWMPRD.

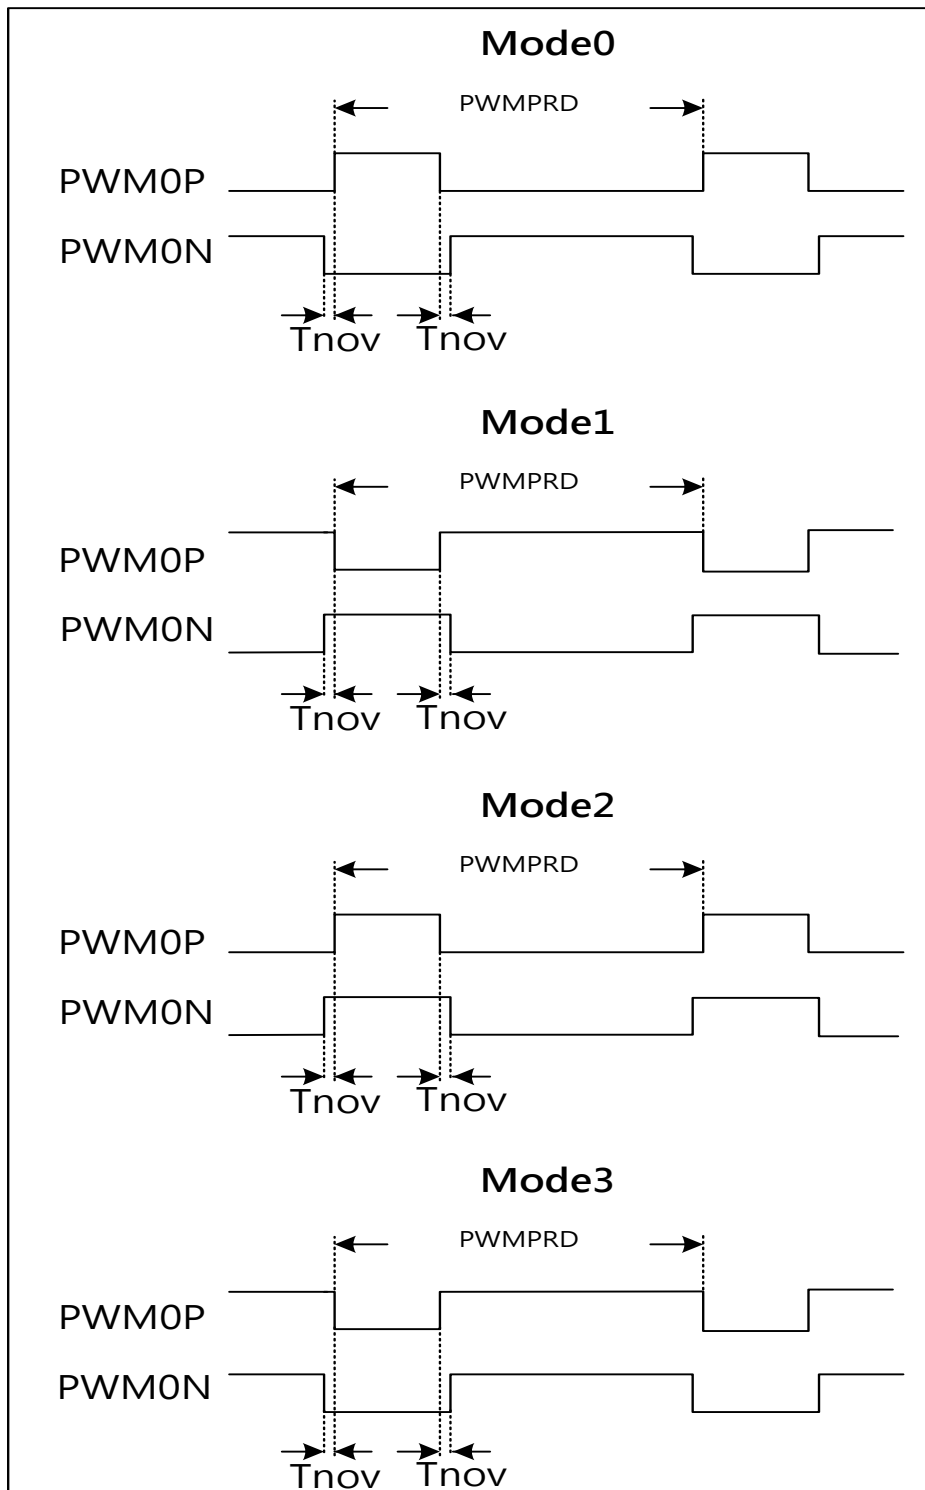

If PWMEN is cleared, the PWM0~5 will be cleared and stopped, otherwise the PWM0~5 remain running. The PWM0 structure is shown as follow. The PWM0 duty cycle can be changed by writing to PWM0DL and PWM0DH. The PWM0 period can be set by writing the period value to PWMPRDL and PWMPRDH register. There is a digital comparator that compares the PWM counter and PWMPRD, if PWM counter is larger than PWMPRD the PWM counter will be cleared and PWM output signal will be set to high level. The PWM output signals PWM0~PWM5 reset to low level whenever the 16-bit base counter matches the PWM duty register PWM0D ~PWM5D individually.

Only PWM0 has dead-zone control (PWM0DZ), and is divided into PWM0P and PWM0N outputs with 4 modes (PWM0OM), and the remaining PWM1~5 have no non-overlap control. The PWM1~5 outputs are PWM1O~PWM5O.

PWM0 Block Diagram

Only PWM0 can be output via PWM0P and PWM0N with four different modes control by PWM0OM (91h.5~4). The edges of PWM pulse can be separated with 16 different time non-overlap clock intervals (T_{nov}). The width of T_{nov} can be selected by PWM0DZ (91h.3~0) within 0~15 pwm clock. The default output form is Mode0. The waveforms of the four output modes are shown below.

PWM0 Waveform Modes

◇ Example: [CPU running at Fast mode, Fsys=FIRC 18.432Mhz]

; Setup PWM0 clock prescaler

```

MOVLW    0000000B    ;

6.6 UART

TM56F1543 has built-in standard UART (Universal Asynchronous Receiver/Transmitter), which is responsible for performing serial communications among computers. Transmitting device changes the parallel data to serial data and sends the bit-stream data via TX line, the receiving device receives the data via RX line in serial form and converts to parallel data stored in register for MCU reading. The TX/RX module also handles data synchronization, parity bit generation and detection, frame error, overrun error, and interrupts generation. Figure 6.6.1 shows the data format of UART

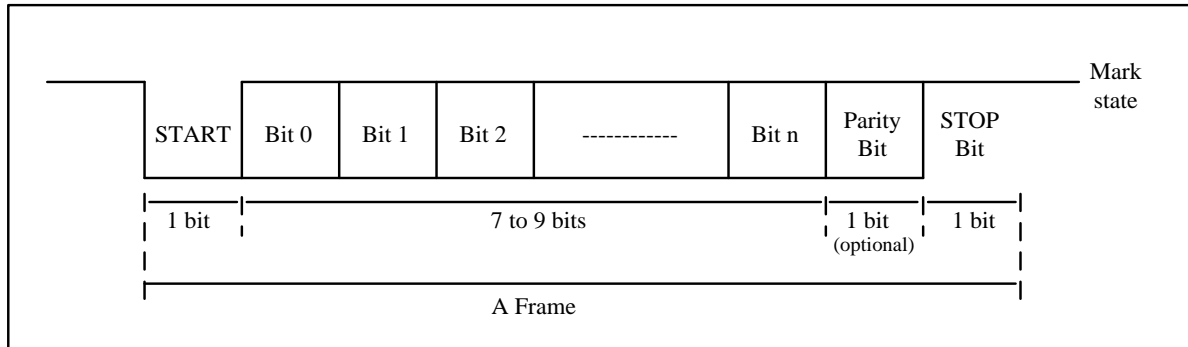

Figure 6.6.1 UART data format

The transmission line is normally kept in mark state (logic 1) until the transmission or reception start with a transition to space state (logic 0). The first bit transmitted is START bit and the length is 1 bit wide (1 bps second), followed by the transmitted bit stream of the data. The LSB (least Significant Bit) is sent first, the number or transmitted bit is defined by UMODE control bits that can have 7, 8 or 9 bits mode to be transmitted or received. The parity bit is followed by data bit and is selectable to be sent or not, but in 9-bit mode transmission, the parity bit is always not to be transmitted.

UART Modes

The UAT can operate in one of three modes, e.g. Mode 0 (7-bit data), Mode 1 (8-bit data) and Mode 2 (9-bit data). The data format of Mode 0 and Mode 1 can transmit/receive parity bit according to PRE bit. If PRE=1, the TX data format will add the parity bit after the data bits, otherwise, the TX only transmits the data bits. Mode 2 does not support parity bit transmit/receive. Note that the setting of UART between two communicating devices must be the same so that the RX part can check the data format and parity the same as TX part. The parity select bit is EVEN bit in UARTS control register. It uses even parity if EVEN=1, else it uses odd parity. Every UART transfer is ended with a STOP bit. If the STOP bit is not seen by RX part, the RX part will set the FMERR bit in UARTS control register to indicate the transfer may not be properly received/transmitted, it must be re-sent again or firmware handling. Figure 6.6.2 shows the data formats of three UART modes.

	UMODE[1:0]	PRE	S	1	2	3	4	5	6	7	8	9	10	
Mode 0	0 0	0	7-bit data							STOP				
	0 0	1	7-bit data							Pty	STOP			
Mode 1	0 1	0	8-bit data								STOP			
	0 1	1	8-bit data								Pty	STOP		
Mode 2	1 1	x	9-bit data									STOP		

Figure 6.6.2 UART Modes

UART System Block

Figure 6.6.3 shows the system block of the UART built in TM56F1543. The Baud Clock Generator divides the F_{sys} to produce the proper frequency of the UART baud rate. The divisor is UBAUD register. Every bit of data stream is sampled by 16 Baud clocks which are generated from Baud Clock Generator. The desired Baud rate can be achieved by setting UBAUD with the following equation:

$$\text{Baud Rate} = \frac{F_{sys}}{32 * \text{UBAUD}}$$

The divided clock (Baud clock) is then sent to TX and RX control logic and TX/RX shift buffers. The TX control logic start sending data out to TX pin (PA3) once the URDATA is written, URTD9 will be sent if the UART mode is Mode 2. When transmit completes, the “TX buffer Empty” signal is asserted, then interrupt will be generated if INTIE1.UARTIE is set. UINVEN will invert the output when it is set to 1, the RX will be inverted when UINVEN is set.

The UART RX signal is input from RX pin (PA2) and then it is inverted if UINVEN is set, passing through a synchronization circuit then clocked to RX shifter. Number of bits to be shifted into RX shifter depends on what UART Mode is operated, and then RX control logic handle them, including frame error detection (FMERR bit), parity detection (PRERR) and overrun error (OVERR) detection. Frame error means that the incoming frame STOP bit is not detected. Parity error means the incoming data parity bit does not equal to the parity of data bits that are evaluated by the RX control logic. Overrun error means the previous transfer that is stored in URDATA has not been read as a new incoming transfer is completed, the old URDATA will be lost when overrun error occurs.

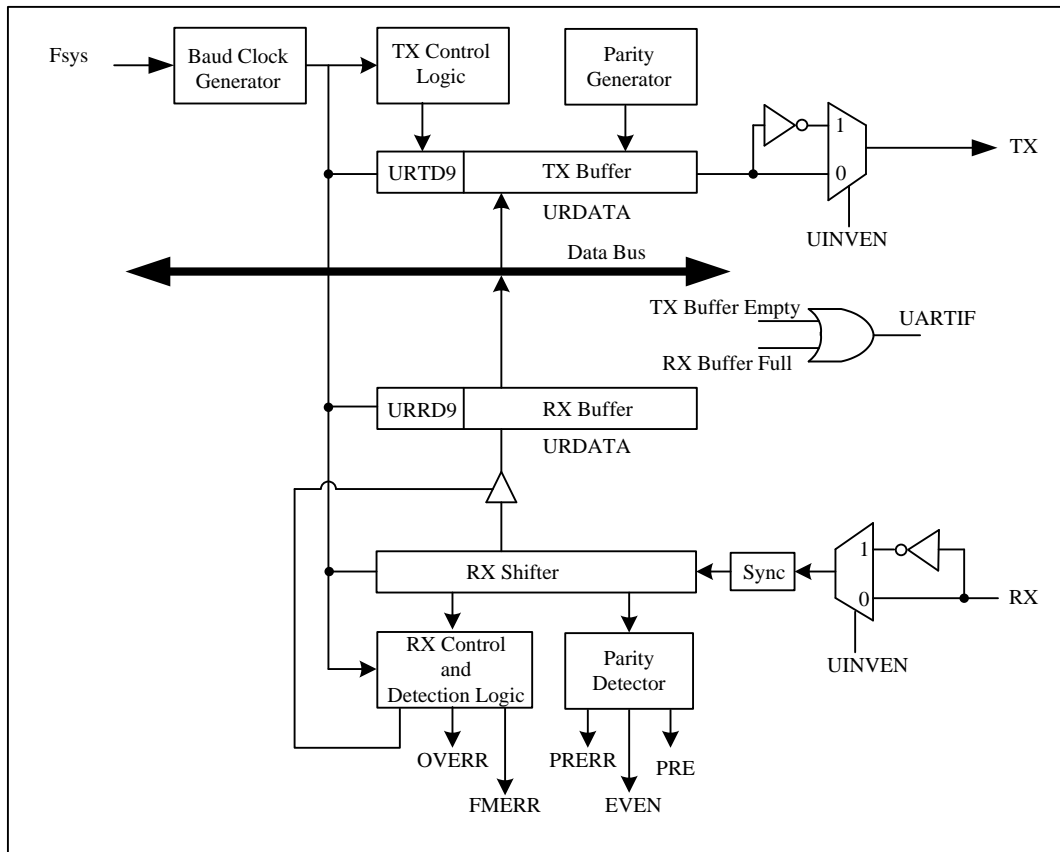

Figure 6.6.3 UART Block Diagram

Table 6.6. lists the common used operating frequency to generate common used Baud Rates under Fsys is 18.432MHz. Some Baud Rates cannot be achieved because frequency error is too large to use.

Fsys (Hz)	Desired Baud Rate (bps)	UBAUD	Actual Generate Baud Rate	Frequency Error(%)	
18432000	2400	240	2400	0	
18432000	4800	120	4800	0	
18432000	9600	60	9600	0	
18432000	14400	40	14400	0	
18432000	19200	30	19200	0

6.7 Analog-to-Digital Converter

The 12-bit ADC (Analog to Digital Converter) consists of a 14-channel analog input multiplexer, control register, clock generator, 12-bit successive approximation register, and output data register. To use the ADC, user needs to set ADCKS (18h.2~0) to choose a proper ADC clock frequency, which must be less than 1 MHz. User then launches the ADC conversion by setting the ADST (18h.3) control bit. After end of conversion, H/W automatic clears the ADST (18h.3) bit. User can poll this bit to know the conversion status. The PxMODx control registers are used for ADC pin configuration, user must set the Pin Mode=3 when the pin is used as an ADC input. The setting can disable the pin logical input path to save power consumption. User needs to set {ADCHS} (19h.4~0) to choose the input channel of ADC. Two of them, AD14 is VBG input for ADC and AD23 is 1/4VCC input for ADC. Besides, VBG is controlled by BGEN (19h.7). ADC reference voltage is selected by ADCVREFS (19h.5).

Example:

[CPU running at FAST mode , Fsys=FIRC 18.432 MHz]
 ADC clock frequency=FIRC/32, ADC channel=ADC10 (PD2).

◇ Example:

```

MOVLW 00000111B ; Fsys=18.432 MHz
MOVWX CLKCTL ;

MOVLW 01110101B ; ADC10 (PD2) Pin Mode=3=ADC input
MOVWX PDMODL;

MOVLW 00000011B ; Fsys=18.432 MHz
MOVWX ADCTL ; 18h.2~0 (ADCKS) =ADC clock=Fsys/32=576KHz

MOVLW 1 00 01010B ; 19h.7=1, enable VBG; 19h.6~5=0, VREF=VCC
MOVWX ADCTL2 ; 19h.4~0 (ADCHS [4:0]) =10, ADC select ADC10 (PD2 pin).

BSX ADST ; 18h.3 (ADST) , ADC start conversion.
  
```

WAIT_ADC:

```

BTXSC ADST ; Wait ADC conversion finish.
LGOTO WAIT_ADC

MOVXW ADH ; 17h.7~0, Read ADC result [11:4] into W
...
MOVXW ADCTL ; 18h.7~4, Read ADC result [3:0] into W
...

6.8 Touch Key

The Touch Key offers an easy, simple and reliable method to implement finger touch detection. In most applications, it doesn't require any external component. The device support 3 modules, 24 channels touch key detection.

To use the Touch Key, user must setup the Pin Mode (*see Section 5*) correctly as below table. Setting Mode2 for an Idling Touch Key pin can CMOS output Low and reduce the mutual interference between the adjacent keys.

PxMODx setting for Touch Key	TK0~TK23
Pin is Touch Key, Idling	CMOS output Low (Mode2)
Pin is Touch Key, Scanning	

There are three Touch Key Modules (Module0, Module1 and Module2) in the TM56F1543. Each module can work independently. In the Touch Key Module, there are two oscillators: Reference Clock (RCKx) and Touch Clock (TCKx). They are connected to the Reference Counter and Data Counter respectively. The frequency of RCKx can be adjusted by setting TKMxREFC. Reference Counter is used to control conversion time. TKMxTCP is touch key clock frequency select (only available in TKMxJMP=0). When TKMxJMP =1, the touch key clock frequency is automatically change.

From starting touch key conversion to end, it will take 0 to 4096 RCK oscillation cycles by setting TKMxTMR. After end of conversion, user can get TK Data (TKMxDH, TKMxDL) from Data counter. TK Data is affected by finger touching. As finger touching TCK is getting slower, the value of TK Data is smaller than the no finger touching. According to the difference of TKMxDATA, user can check if it is touched or not. A suitable TKMxTMR and TKMxREFC setting can adjust TK Data to adapt the system board circumstances. To get the best TKMxREFC setting, user can try different TKMxREFC value, and then find the one which makes the TK Data and TKMxTMR as close as possible. In the other hand, user can adjust the overall operating frequency of the TK system (including TCKx & RCKx) by setting TKMxFSL (frequency select). For all Touch Key Module, there is a control signal TKMHSENSE (11Fh.7) can be set to enhance the Touch key performance.

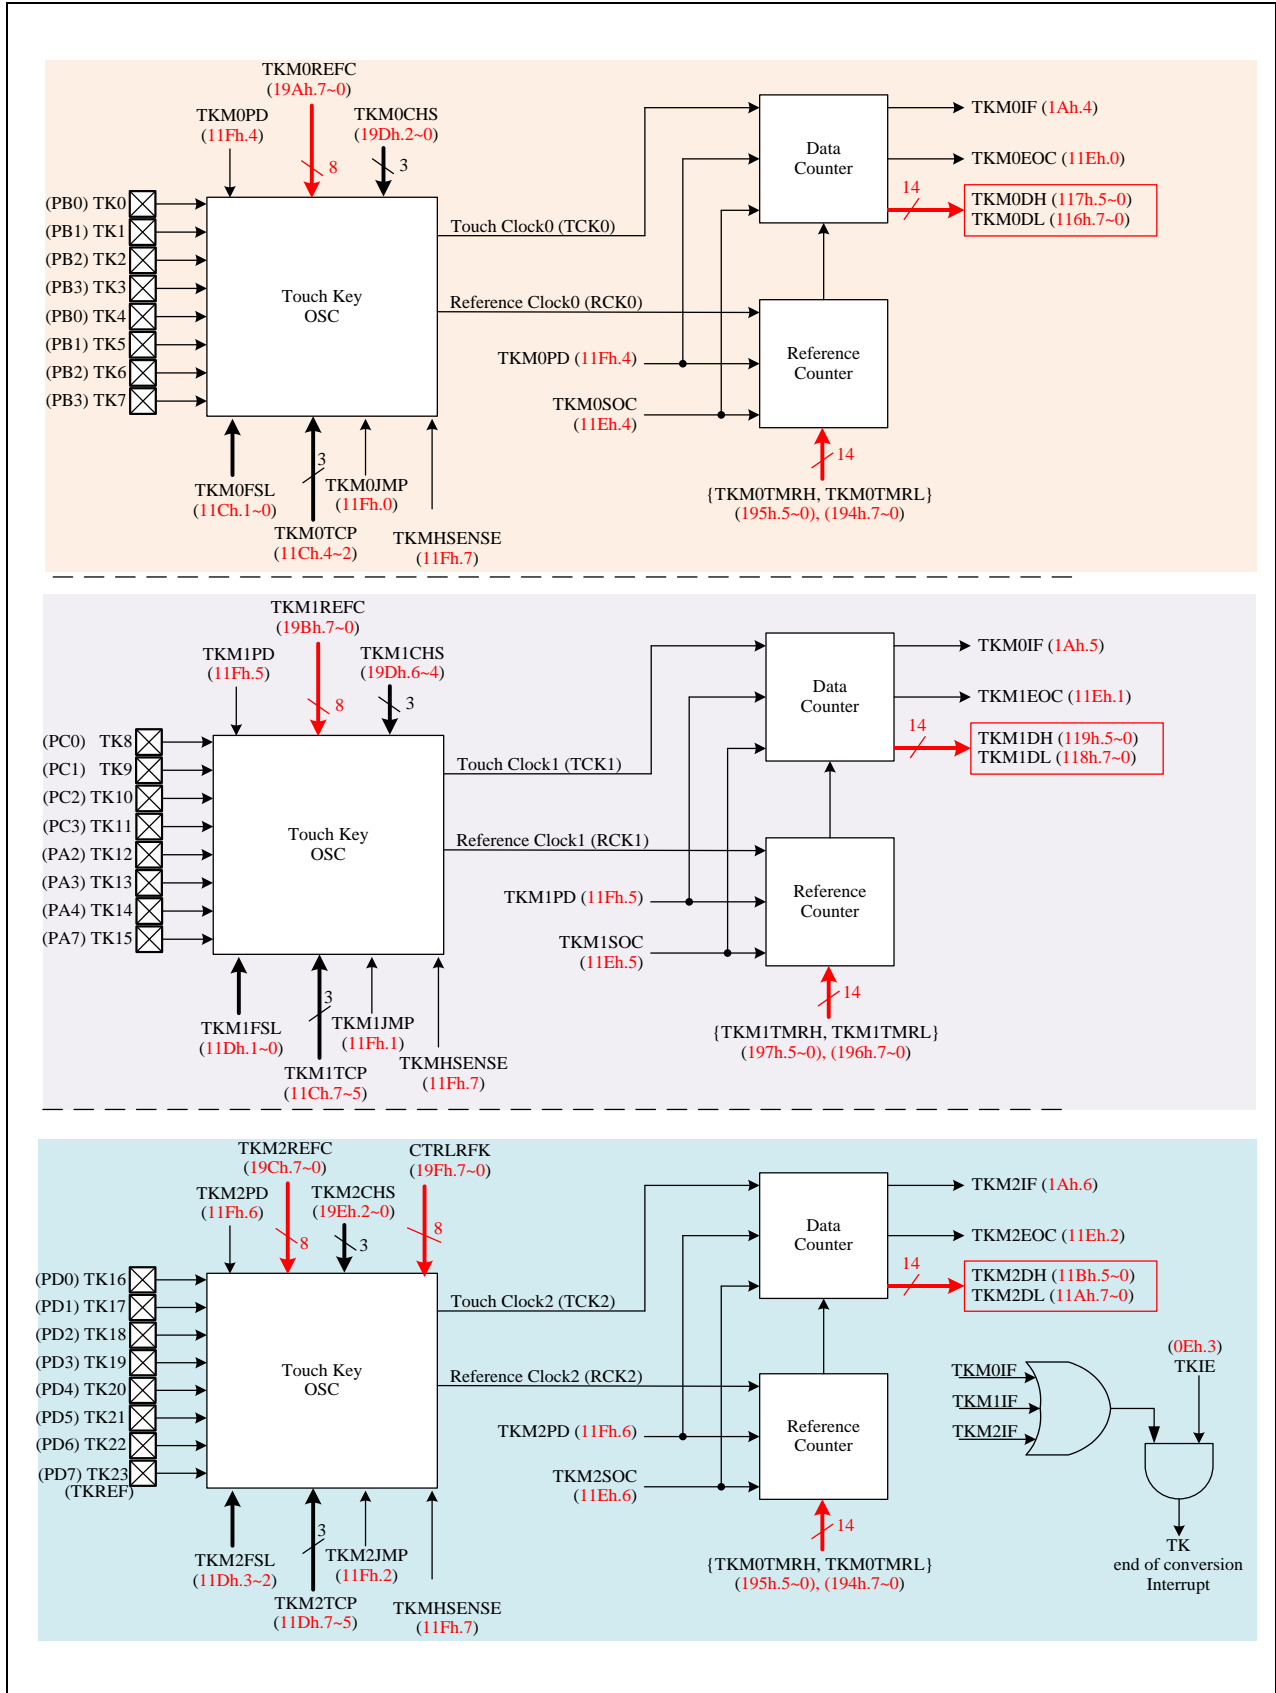

To start the Scanning, user assigns TKMxPD=0, then set the TKMxSOC bit to start touch key conversion, the TKMxSOC bit can be automatically cleared while end of conversion. However, if the SYSCLK is too slow, H/W might fail to clear TKMxSOC due to clock sampling rate. TKMxEOC=0 means conversion is in process. TKMxEOC=1 means the conversion is finish, and the touch key counting result is stored into the 12 bits TK Data Counter TKMxDH and TKMxDL.

TKIF (sum of TKM0IF, TKM1IF and TKM2IF) will active at the first time enable Touch Key function (TKMxPD=0), user should clear TKIF after TKMxPD cleared.

Touch Key Channel 23 (PD7) can set as reference key. The capacitor of the reference key is control by CTRLRFK (19F.7~0). (00: minimum capacitor on TK23, FF: maximum capacitor on TK23)

TKM0IF	TKM1IF	TKM2IF	TKIF	STATE
0	0	0	0	IDLE
1	0	0	1	TK Module0 is end of conversion
0	1	0	1	TK Module1 is end of conversion
1	1	0	1	TK Module0 and Module1 are both end of conversion
0	0	1	1	TK Module2 is end of conversion
1	0	1	1	TK Module0 and Module2 are both end of conversion
0	1	1	1	TK Module1 and Module2 are both end of conversion
1	1	1	1	All TK module are end of conversion

Touch Key Interrupt Flag Description

Touch Key Structure

- ◇ Example: Use TK module0, Module1 and Module2, Touch key channel = TK2 (PB2), TK8 (PC0), TK20 (PD4)

6.9 Specific Purpose Slave I2C Interface

Specific purpose slave I2C interface in TM56F1543 could be used for data transmission. This interface is based on a standard I2C (Inter-Integrated Circuit), and TM56F1543 is always as a slave mode. When the master node (another IC or device) sends the correct ID through I2C, it can read data from the register I2CTXD0 (110h.7~0) and I2CTXD1 (111h.7~0) of TM56F1543 or write data to the register I2CRCDO (114h.7~0) and I2CRCDD1 (115h.7~0) of TM56F1543.

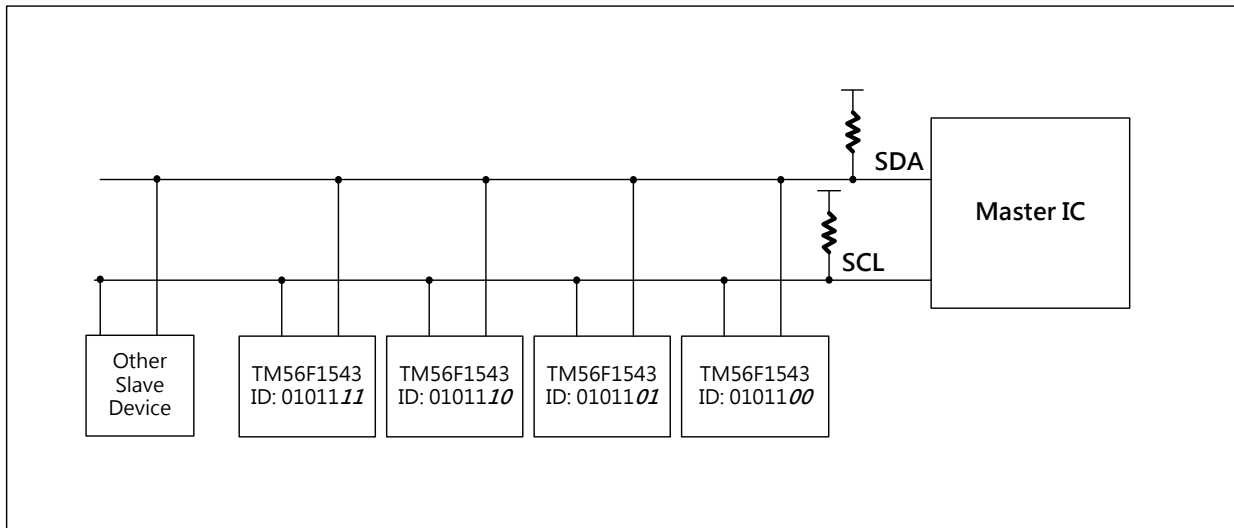

Slave I2C Interface Block Diagram

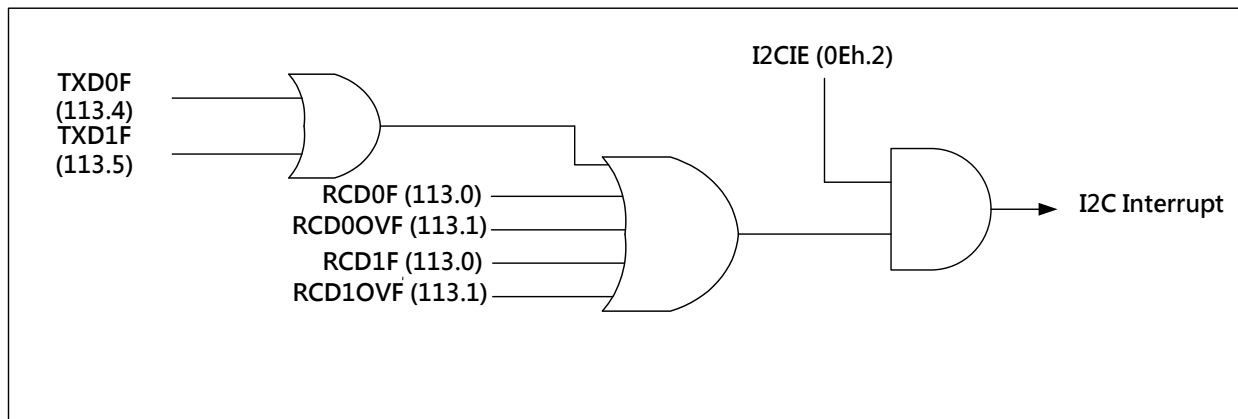

I2C Protocol

To use the slave I2C interface, the I2CEN (112h.3) bit has to be set. TM56F1543 supports 4 slave device IDs by setting I2CID (112.1~0). TM56F1543 can generate the transmitting flag TXD0F (113h.4) and TXD1F (113h.5) when data transmitting finished. It generates the receiving flag RCD0F (113h.0) and RCD1F (113h.2) when data receiving finished. It can also generate the receiving overflow flag RCD0OVF (113h.1) and RCD1OVF (113h.3) when data receiving finished but the receiving flag is not cleared. If one of those I2C flags is set, the I2C interrupt flag I2CIF (1Ah.2) will be generated. It generates I2C interrupt if the I2CIE (0Eh.2) bit is set. Refer to following table and figure.

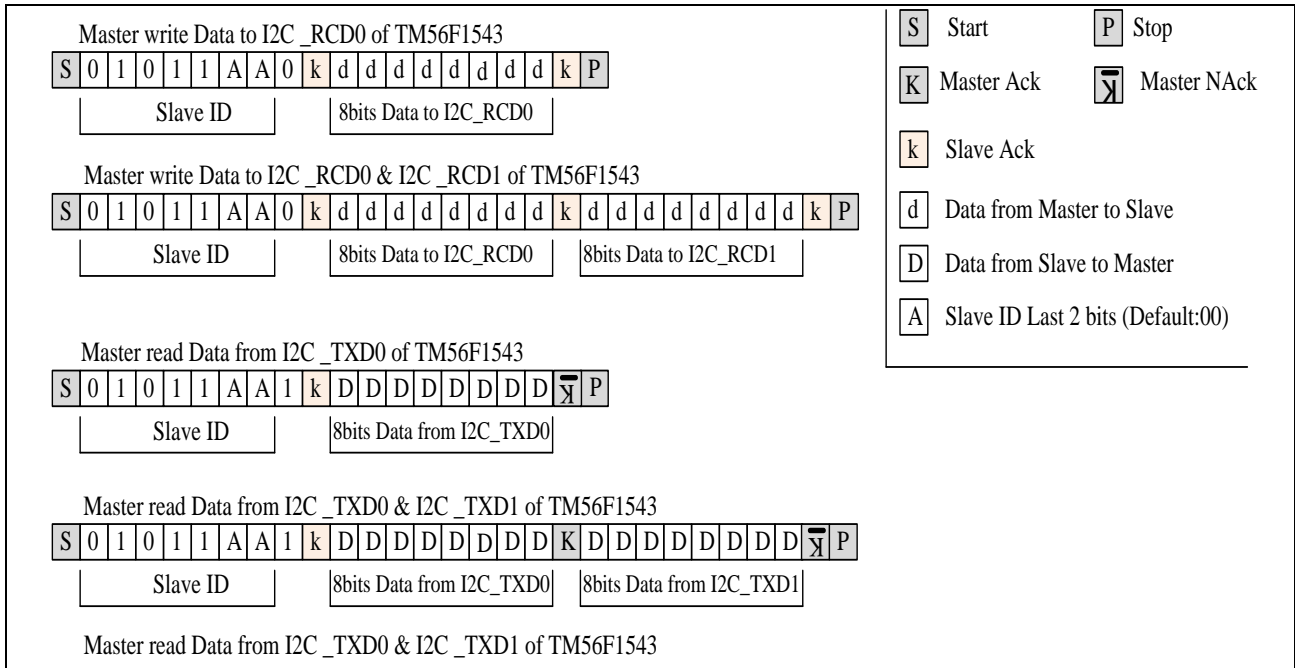

I2C Parallel Connection Application Circuit

Slave I2C Interrupt Block Diagram

1Ah.2 **I2CIF**: Slave I2C interrupt pending flag; refer to 113h (I2CFLG)

This bit is set by H/W while

- ✧ I2CRCD0 or I2CRCD1 receive data finished
- ✧ I2CRCD0 or I2CRCD1 data overflow occurred
- ✧ I2CTXD0 or I2CTXD1 data transmit finished

Write 0 to this bit will clear this flag and slave I2C related flags.

6.10 S/W Control LCD Driver

The chip support an S/W controlled method to driving LCD. Four IO pins can be the Common Pins. The four pin are PA0, PA1, PD6 and PD7. Common pins are capable of driving 1/2 bias by setting the register LOE. The COM0 circuit is shown below.

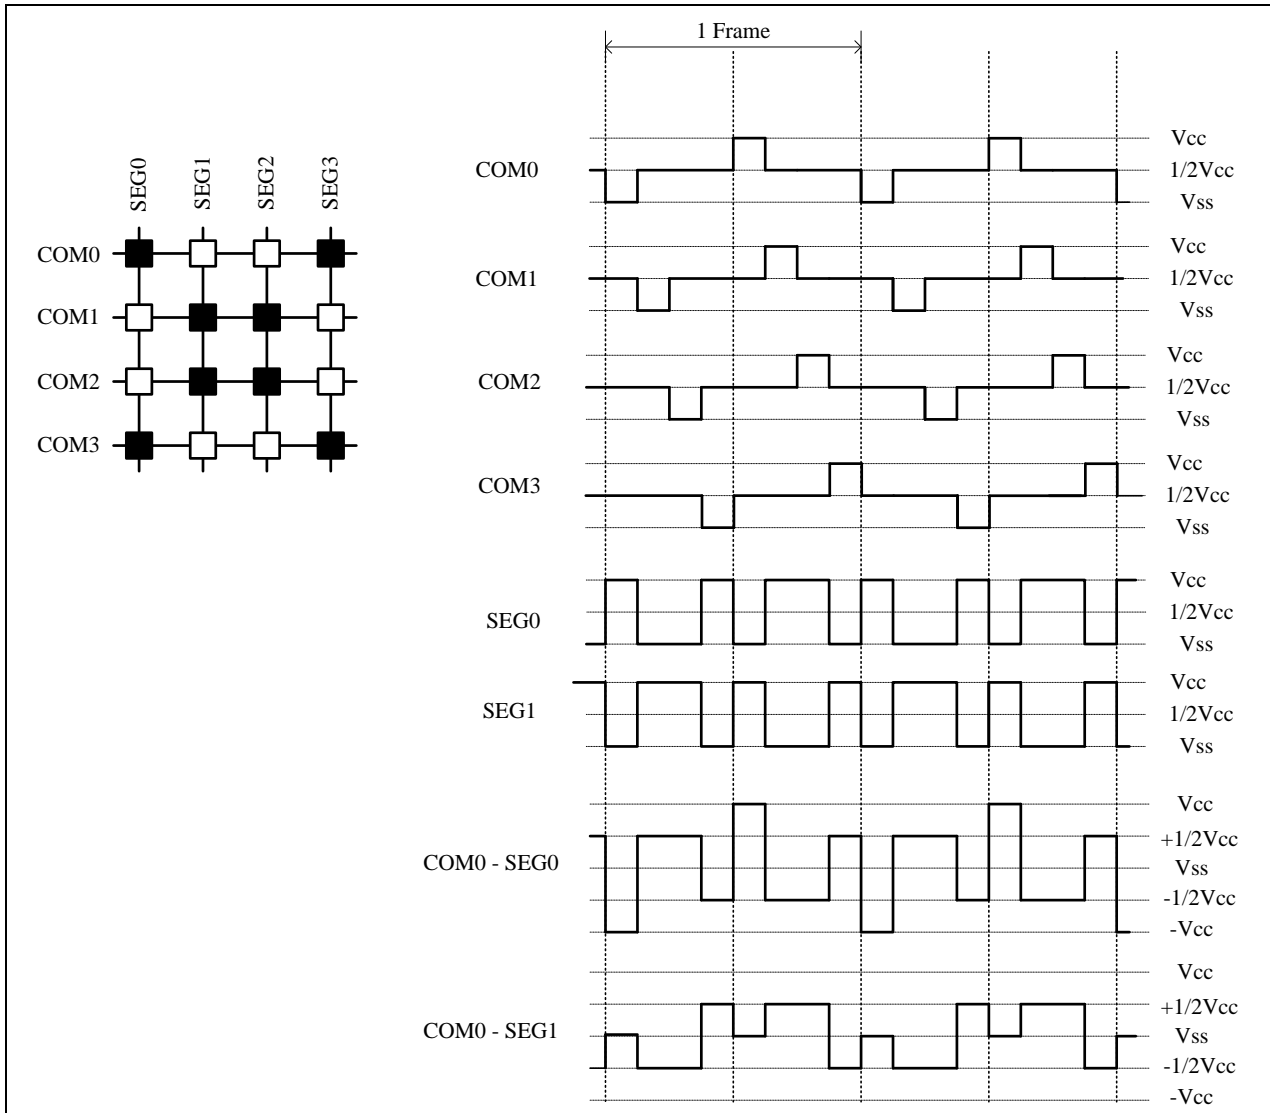

LCD COM0 Circuit

The frequency of any repeating waveform output on the COM pin can be used to represent the LCD frame rate. The figure below shows an LCD frame.

S/W Controlled LCD COM0 ~ COM3 Scanning

 1000: COM3 (PA1) Enable

6.11 Cyclic Redundancy Check (CRC)

The chip supports an integrated 16-bit Cyclic Redundancy Check function. The Cyclic Redundancy Check (CRC) calculation unit is an error detection technique test algorithm and uses to verify data transmission or storage data correctness. The CRC calculation takes an 8-bit data stream or a block of data as input and generates a 16-bit output remainder. The data stream is calculated by the same generator polynomial.

CRC16 Block Diagram

The CRC generator provides the 16-bit CRC result calculation based on the CRC-16-IBM polynomial. In this CRC generator, there is only one polynomial available for the numeric values calculation. It can't support the 16-bit CRC calculations based on any other polynomials. Each write operation to the CRCIN register creates a combination of the previous CRC value stored in the CRCDH and CRCDL registers. It will take one MCU instruction cycle to calculate.

CRC-16-IBM (Modbus) Polynomial representation: $X^{16} + X^{15} + X^2 + 1$

6.12 In Circuit Emulation (ICE) Mode

This device can support the In Circuit Emulation Mode. To use ICE Mode, user needs to connect PA0 and PA1 pin to the tenx proprietary EV Module. The benefit is that user can emulate the whole system without changing the on board target device. But there are some limits for the ICE mode as below.

- ✧ The device must be un-protect.
- ✧ The device's PA0 and PA1 pins must work in input Mode.
- ✧ The HT-Link communication Pin's function cannot be emulated.
- ✧ The PA0 and PA1 pins can be replaced by PC0 and PC1 (only in ICE Mode)
- ✧ The VCC level is controlled by HT-Link module.

INTIF1 (1Ah)				Function related to: Interrupt Flag
LVDIF	1A.7	R/W	0	LVD interrupt event pending flag, set by H/W while LV Detected write 0: clear this flag; write 1: no action
TKM2IF	1A.6	R/W	0	STK Module2 Interrupt event pending flag set by H/W at the STK module2 end of conversion S/W writes 0 to TKM2IF or sets the TKM2SOC bit to clear this flag.
TKM1IF	1A.5	R/W	0	STK Module1 Interrupt event pending flag set by H/W at the STK module1 end of conversion S/W writes 0 to TKM1IF or sets the TKM1SOC bit to clear this flag.
TKM0IF	1A.4	R/W	0	STK Module0 Interrupt event pending flag set by H/W at the STK module0 end of conversion S/W writes 0 to TKM0IF or sets the TKM0SOC bit to clear this flag.
TKIF	1A.3	R/W	0	Touch Key interrupt event pending flag, set by H/W at the end of All Touch Key conversion S/W writes 0 to TKIF or sets the TKMxSOC bit to clear this flag.
I2CIF	1A.2	R/W	0	Slave I2C interrupt pending flag This bit is set by H/W while <ul style="list-style-type: none"> ◇ I2CRCD0 or I2CRCD1 receive data finished ◇ I2CRCD0 or I2CRCD1 data overflow occurred ◇ I2CTXD0 or I2CTXD1 data transmit finished. Write 0 to clear this flag
UARTIF	1A.1	R/W	0	UART Interrupt Flag, set by H/W while TX/RX transfers complete; F/W write 0 to clear this flag
PXIF	1A.0	R/W	0	Port A/B/C/D Pin Change Interrupt Flag F/W write 0 to clear this flag;
IOCTRL (1Bh)				Function related to: IO Port
LED	1B.7~4	R/W	0	IO current Control for LED usage enable LED[3]: PD port LED[2]: PC port LED[1]: PB port LED[0]: PA port 1: enable, 0 disable
HSNK	1B.3~0	R/W	0	IO current Control for High Sink usage enable HSNK[3]: PD port HSNK[2]: PC port HSNK[1]: PB port HSNK[0]: PA port 1: enable, 0: disable
PAWKE (1Ch)				Function related to: Port A
PAWKE	1C.7~0	R/W	0	PA pin Individual Wake up Enable 0: disable 1: enable
PBWKE (1Dh)				Function related to: Port B
PBWKE	1D.7~0	R/W	0	PB pin Individual Wake up Enable 0: disable 1: enable
PCWKE (1Eh)				Function related to: Port C
PCWKE	1E.7~0	R/W	0	PC pin Individual Wake up Enable 0: disable 1: enable

Name	Address	R/W	Rst	Description
PDWKE (1Fh)		Function related to: Port D		
PDWKE	1F.7~0	R/W	0	PD pin Individual Wake up Enable 0: disable 1: enable
User Data Memory				
RAM	20~6F	R/W	-	RAM Bank0 area (80 Bytes)
RAM	70~7F	R/W	-	RAM common area (16 Bytes)

Name	Address	R/W	Rst	Description
OPTION (81h/181h)				Function related to: STATUS/INT0/INT1/WDT/WKT
HWAUTO	81.7	R/W	0	Enter interrupt vector, HW auto save/restore WREG and STATUS w/o TO, PD 0:disable 1: Enable
INT0EDG	81.6	R/W	0	INT0 pin edge interrupt event 0: falling edge to trigger 1: rising edge to trigger
INT1EDG	81.5	R/W	0	INT1 pin edge interrupt event 0: falling edge to trigger 1: rising edge to trigger
FREQ	81.4	R/W	1	SIRC Frequency selection 0: 60KHz 1: 50KHz
WDTOSC	81.3~2	R/W	11	WDT pre-scale selections: 00: 164mS 01: 328mS 10: 655mS 11: 1311mS
WKTOSC	81.1~0	R/W	11	WKT pre-scale selections: 00: 21mS 01: 41mS 10: 82mS 11: 164mS
PAMODH (85h)				Function related to: Port A
PA7MOD	85.7~6	R/W	01	PA7, PA4 I/O mode control 00: Mode0 01: Mode1
PA4MOD	85.1~0	R/W	01	10: Mode2 11: Mode3
PAMODL (86h)				Function related to: Port A
PA3MOD	86.7~6	R/W	01	PA3~PA0 I/O mode control
PA2MOD	86.5~4	R/W	01	00: Mode0
PA1MOD	86.3~2	R/W	01	01: Mode1
PA0MOD	86.1~0	R/W	01	10: Mode2 11: Mode3
PBMODH (87h)				Function related to: Port B
PB7MOD	87.7~6	R/W	01	PB7~PB4 I/O mode control
PB6MOD	87.5~4	R/W	01	00: Mode0
PB5MOD	87.3~2	R/W	01	01: Mode1
PB4MOD	87.1~0	R/W	01	10: Mode2 11: Mode3
PBMODL (88h)				Function related to: Port B
PB3MOD	88.7~6	R/W	01	PB3~PB0 I/O mode control
PB2MOD	88.5~4	R/W	01	00: Mode0
PB1MOD	88.3~2	R/W	01	01: Mode1
PB0MOD	88.1~0	R/W	01	10: Mode2 11: Mode3
PCMODL (8Ch)				Function related to: Port C
PC3MOD	8C.7~6	R/W	01	PC3~PC0 I/O mode control
PC2MOD	8C.5~4	R/W	01	00: Mode0
PC1MOD	8C.3~2	R/W	01	01: Mode1
PC0MOD	8C.1~0	R/W	01	10: Mode2 11: Mode3

Name	Address	R/W	Rst	Description
PDMODH (8Dh)				Function related to: Port D
PD7MOD	8D.7~6	R/W	01	PD7~PD4 I/O mode control
PD6MOD	8D.5~4	R/W	01	00: Mode0
PD5MOD	8D.3~2	R/W	01	01: Mode1
PD4MOD	8D.1~0	R/W	01	10: Mode2 11: Mode3
PDMODL (8Eh)				Function related to: Port D
PD3MOD	8E.7~6	R/W	01	Pd3~PD0 I/O mode control
PD2MOD	8E.5~4	R/W	01	00: Mode0
PD1MOD	8E.3~2	R/W	01	01: Mode1
PD0MOD	8E.1~0	R/W	01	10: Mode2 11: Mode3
OPTION2 (8Fh)				Function related to: PWM0/PWM1
TCOE	8F.7	R/W	0	TCOUT Output Enable 0: Disable 1: Enable, output to PB1
TM1OE	8F.6	R/W	0	Timer1 overflow toggle Output Enable 0: Disable 1:Enable, output to PB0
PWMCKS	8F.5~4	R/W	0	PWM0 Clock Source 0x: Fsys 10:FIRC 11:FIRC*2
INT2SEL	8F.2	R/W	0	INT2 Pin Select 0: PA7 1: PB7
INT1SEL	8F.1	R/W	0	INT1 Pin Select 0: PA4 1: PB4
INT0SEL	8F.0	R/W	0	INT0 Pin Select 0: PA0 1: PB0
PWMOE (90h)				Function related to: PWM0/PWM1
PWM0POE	90.7	R/W	0	PWM0P Output Enable to PA7 0: disable 1: enable
PWM0NOE	90.6	R/W	1	PWM0N Output Enable to PA0 0: disable 1: enable
PWM5OE	90.5	R/W	1	PWM5 Output Enable to PA7 0: disable 1: enable (PWM0POE has higher priority)
PWM4OE	90.4	R/W	1	PWM4 Output Enable to PA4 0: disable 1: enable
PWM3OE	90.3	R/W	1	PWM3 Output Enable to PA3 0: disable 1: enable
PWM2OE	90.2	R/W	0	PWM2 Output Enable to PA2 0: disable 1: enable
PWM1OE	90.1	R/W	0	PWM1 Output Enable to PA1 0: disable 1: enable

Name	Address	R/W	Rst	Description
PWMCTL (91h)				Function related to: PWM
PWMEN	91.7	R/W	0	PWM Clock Enable 0: Disable 1: Enable
PWM0OM	91.5~4	R/W	0	PWM0 output mode 00~11: Mode0 ~Mode3
PWM0DZ	91.3~0	R/W	0	PWM0 dead zone (non-overlap) 0000~1111: 0~14, 16 *Tpwmclk
PWMPRDH (92h)				Function related to: PWM
PWMPRDH	92.7~0	R/W	0	PWM Period MSB data
PWMPRDL (93h)				Function related to: PWM
PWMPRDL	93.7~0	R/W	0	PWM Period LSB data
PWM0DH (94h)				Function related to: PWM
PWM0DH	94.7~0	R/W	0	PWM0 DutyMSB data
PWM0DL (95h)				Function related to: PWM
PWM0DL	95.7~0	R/W	0	PWM0 Duty LSB data
PWM1DH (96h)				Function related to: PWM
PWM1DH	96.7~0	R/W	0	PWM1 Duty MSB data
PWM1DL (97h)				Function related to: PWM
PWM1DL	97.7~0	R/W	0	PWM1 Duty LSB data
PWM2DH (98h)				Function related to: PWM
PWM2DH	98.7~0	R/W	0	PWM2 Duty MSB data
PWM2DL (99h)				Function related to: PWM
PWM2DL	99.7~0	R/W	0	PWM2 Duty LSB data
PWM3DH (9Ah)				Function related to: PWM
PWM3DH	9A.7~0	R/W	0	PWM3 Duty MSB data
PWM3DL (9Bh)				Function related to: PWM
PWM3DL	9B.7~0	R/W	0	PWM3 Duty LSB data
PWM4DH (9Ch)				Function related to: PWM
PWM4DH	9C.7~0	R/W	0	PWM4 Duty MSB data
PWM4DL (9Dh)				Function related to: PWM
PWM4DL	9D.7~0	R/W	0	PWM4 Duty LSB data
PWM5DH (9Eh)				Function related to: PWM
PWM5DH	9E.7~0	R/W	0	PWM5 Duty MSB data
PWM5DL (9Fh)				Function related to: PWM
PWM5DL	9F.7~0	R/W	0	PWM5 Duty LSB data
User Data Memory				
RAM	A0~EF	R/W	-	RAM Bank I area (80 Bytes)

Name	Address	R/W	Rst	Description
TSTREG (105h) Function related to: TEST				
TSTREG	105.7~0	R/W	03	Test bits, Keep 03
ChgRdMode (106h) Function related to: TEST				
ChgRdMode	105.7~0	W	0	Test bits, Keep 00
LVRPD (107h) Function related to: LVR				
LVRPD	107	W	0	LVR power down control Write 0x37 to force LVR+POR disable Write 0x38 to force LVR disable, POR still enable Write 0x39 to force POR disable, LVR still enable Write other value to enable LVR/POR
PORPDF	107.1	R	0	1: when Reg. 107h write 0x37 or 0x39; 0: when Reg. 107h write other value
LVRPDF	107.0	R	0	1: when Reg. 107h write 0x37 or 0x38; 0: when Reg. 107h write other value
LOE (108h) Function related to: Software LCD COM				
LOE	108	R/W	0	Software COM3~0 LCD 1/2 bias Output Enable
	108.3	R/W	0	1: PA1 as LCD COM3 1/2 bias Output Enable
	108.2	R/W	0	1: PA0 as LCD COM2 1/2 bias Output Enable
	108.1	R/W	0	1: PD6 as LCD COM1 1/2 bias Output Enable
	108.0	R/W	0	1: PD7 as LCD COM0 1/2 bias Output Enable
PCH (10Ch) Function related to: PC				
PCH	10C.4~0	R	0	Program Counter [12:8]
		W	0	Write 1Ch to this register, then it's not necessary to write PCLATCH for table read lookup
UBAUD (10Dh) Function related to: UART				
UBAUD	10D	R/W	0	UART Baud Rate divider
BGTRIM (10Eh) Function related to: VBG				
BGTRIM	10E.3~0	R/W		VBG voltage adjustment 00h: Lowest voltage Fh: Highest voltage
I2CTXD0 (110h) Function related to: Slave I2C				
I2CTXD0	110.7~0	R/W	0	The transmitting register0 of slave I2C
I2CTXD1 (111h) Function related to: Slave I2C				
I2CTXD1	111.7~0	R/W	0	The transmitting register1 of slave I2C
I2CCTL (112h) Function related to: Slave I2C				
I2CEN	112.3	R/W	0	Slave I2C interface enable 0: Disable 1: Enable
I2CID	112.1~0	R/W	0	Slave I2C ID last 2 bits

Name	Address	R/W	Rst	Description
I2CFLG (113h)				Function related to: Touch Key Module0
TXD1F	113.5	R/W	0	Slave I2C transmitting data register 1 flag, set by H/W while I2CTXD1 data transmitting finished Write 0 to clear this flag
TXD0F	113.4	R/W	0	Slave I2C transmitting data register 0 flag, set by H/W while I2CTXD0 data transmitting finished Write 0 to clear this flag
RCD1OVF	113.3	R/W	0	Slave I2C receiving data register 1 overflow, set by H/W while receiving data to I2CRCDD1 overflow. Write 0 to clear this flag
RCD1F	113.2	R/W	0	Slave I2C receiving data register 1 flag, set by H/W while I2CRCDD1 data receiving finished Write 0 to clear this flag
RCD0OVF	113.1	R/W	0	Slave I2C receiving data register 0 overflows, set by H/W while receiving data to I2CRCDD0 overflow. Write 0 to clear this flag
RCD0F	113.0	R/W	0	Slave I2C receiving data register 0 flag, set by H/W while I2CRCDD0 data receiving finished Write 0 to clear this flag
I2CRCDD0 (114h)				Function related to: Slave I2C
I2CRCDD0	114.7~0	R	0	The receiving register0 of slave I2C
I2CRCDD1 (115h)				Function related to: Slave I2C
I2CRCDD1	115.7~0	R	0	The receiving register1 of slave I2C
TKM0DL (116h)				Function related to: Touch Key Module0
TKM0DL	116.7~0	R	-	STK Module0 Data LSB [7~0]
TKM0DH (117h)				Function related to: Touch Key Module0
TKM0DH	117.5~0	R	-	STK Module0 Data MSB [13~8]
TKM1DL (118h)				Function related to: Touch Key Module1
TKM1DL	118.7~0	R	-	STK Module1 Data LSB [7~0]
TKM1DH (119h)				Function related to: Touch Key Module1
TKM1DH	119.5~0	R	-	STK Module1 Data MSB [13~8]
TKM2DL (11Ah)				Function related to: Touch Key Module2
TKM2DL	11A.7~0	R	-	STK Module2 Data LSB [7~0]
TKM2DH (11Bh)				Function related to: Touch Key Module2
TKM2DH	11B.5~0	R	-	STK Module2 Data MSB [13~8]
TKMCON0 (11Ch)				Function related to: Touch Key Module
TKM1TCP	11C.7~5	R/W	1	TK module1 touch key clock frequency select; 000:slowest, ..., 111:fastest
TKM0TCP	11C.4~2	R/W	1	TK module0 touch key clock frequency select; 000:slowest, ..., 111:fastest
TKM0FSL	11C.1~0	R/W	0	TK module0 clock(RCK0/TCK0) frequency selection; 00: slowest, ..., 11: fastest

Name	Address	R/W	Rst	Description
TKMCON1 (11Dh)				Function related to: Touch Key Module
TKM2TCP	11D.7~5	R/W	1	TK module2 touch key clock frequency select; 000:slowest, ..., 111:fastest
TKM2FSL	11D.3~2	R/W	0	TK module2 clock(RCK2/TCK2) frequency selection; 00: slowest, ..., 11: fastest
TKM1FSL	11D.1~0	R/W	0	TK module1 clock(RCK1/TCK1) frequency selection; 00: slowest, ..., 11: fastest
TKMCTL0 (11Eh)				Function related to: Touch Key Module
TKM2SOC	11E.6	R/W	0	STK Module2 Start of Conversion, HW clear it while end of conversion
TKM1SOC	11E.5	R/W	0	STK Module1 Start of Conversion, HW clear it while end of conversion
TKM0SOC	11E.4	R/W	0	STK Module0 Start of Conversion, HW clear it while end of conversion
TKM2EOC	11E.2	R	-	STK Module2 End of Conversion
TKM1EOC	11E.1	R	-	STK Module1 End of Conversion
TKM0EOC	11E.0	R	-	STK Module0 End of Conversion
TKMCTL1 (11Fh)				Function related to: Touch Key Module
TKMHSEN	11F.7	R/W	0	All STK Module Sensitivity 0: lower sensitivity 1: higher sensitivity
TKM2PD	11F.6	R/W	1	STK Module2 Power Down 0: Touch Key disable Power Down 1: Touch Key enable Power Down
TKM1PD	11F.5	R/W	1	STK Module1 Power Down 0: Touch Key disable Power Down 1: Touch Key enable Power Down
TKM0PD	11F.4	R/W	1	STK Module0 Power Down 0: Touch Key disable Power Down 1: Touch Key enable Power Down
TKM2JMP	11F.2	R/W	0	STK Module2 touch key clock mode 0: fixed frequency 1: auto-change frequency
TKM1JMP	11F.1	R/W	0	STK Module1 touch key clock mode 0: fixed frequency 1: auto-change frequency
TKM0JMP	11F.0	R/W	0	STK Module0 touch key clock mode 0: fixed frequency 1: auto-change frequency
User Data Memory				
RAM	120~16F	R/W	-	RAM Bank2 area (80 Bytes)

Name	Address	R/W	Rst	Description
DPL (185h) Function related to: Table Read				
DPL	185.7~0	R/W	0	Table read low address, data ROM pointer (DPTR) low byte
DPH (186h) Function related to: Table Read				
DPH	186.4~0	R/W	0	Table read high address, data ROM pointer (DPTR) high byte
UARTCTL (187h) Function related to: UART Control				
URTD9	187.7	R/W	0	UART Transmitted 9th bit
UMODE	187.6~5	R/W	0	UART Mode Selection 0: 7-bit, 1: 8-bit, 2: 9-bit, 3: Reserved
UTXE	187.3	R/W	0	UART Transmit Enable 0: Disable 1: Enable
URXE	187.2	R/W	0	UART Receive Enable 0: Disable 1: Enable
UARTE	187.1	R/W	0	UART Function Enable 0: Disable 1: Enable
UINVEN	187.0	R/W	0	UART TX/RX output/input Inversion Enable 0: Disable 1: Enable
UARTSTA (188h) Function related to: UART Status and Control				
UTBE	188.7	R	0	0: TX is transmitting 1: TX buffer is empty;
URRD9	188.6	R	0	Received 9th bit
EVEN	188.5	R/W	0	UART Parity ; 0: ODD 1: EVEN,
PRE	188.4	R/W	0	UART Parity addition; 0: Disable 1: Enable,
PRERR	188.3	R/W	0	set to 1 when parity error occurs, F/W write 0 to clear it
OVERR	188.2	R/W	0	set to 1 when overrun error occurs, F/W write 0 to clear it
FMERR	188.1	R/W	0	set to 1 when frame error occurs, F/W write 0 to clear it
URBF	188.0	R/W	0	set to 1 when 1 byte (or 9-bit) is received Read UARTDAT register will clear it to 0
TABR (18Ch) Function related to: Table Read				
TABR	18C.7~0	R/W	0	1: TABR write 1 = opcode TABRL 2: TABR write 2 = opcode TABRH 3: after step1 or step2, read TABR to get main ROM table read value after step1, read TABR to get EEPROM value (when EEPEN=E2h) Table Read for ASM: TABRL/TABRH or TABR Table Read for C: TABR

Name	Address	R/W	Rst	Description
URDATA (18Dh)				Function related to: UART DATA
URDATA	18D.7~0	R/W	0	UART TX/RX Data Buffer
		R	0	from Receive Buffer
		W	0	to Transmit shifter
CRCDL (18Eh)				Function related to: CRC16
CRCDL	18E.7~0	R/W	0	CRC16 Data 7~0
CRCDH(18Fh)				Function related to: CRC16
CRCDH	18F.7~0	R/W	0	CRC16 Data 15~8
CRCIN(190h)				Function related to: CRC16
CRCIN	190.7~0	W	0	CRC input data
EEPCTL (191h)				Function related to: EEPROM
EEPTO	191.7	R	0	EEPROM Write Time-out flag
EEPTTE	191.1~0	R/W	11	EEPROM Write Time-out enable; 00: Disable; 01:2.5ms; 10:10ms; 11:20.5ms
EEPEN (192h)				Function related to: EEPROM
EEPEN	192.7~0	W	0	EEPROM Enable 0xE2: Enable Others: Disable
EEPDT (193h)				Function related to: EEPROM
EEPDT	193.7~0	W	0	EEPROM Data to write in
TKM0TMRL (194h)				Function related to: Touch Key Module0
TKM0TMRL	194.7~0	R/W	FF	STK Module0 reference counter LSB [7~0]
TKM0TMRH (195h)				Function related to: Touch Key Module0
TKM0TMRH	195.5~0	R/W	0	STK Module0 reference counter MSB [13~8]
TKM1TMRL (196h)				Function related to: Touch Key Module1
TKM1TMRL	196.7~0	R/W	FF	STK Module1 reference counter LSB [7~0]
TKM1TMRH (197h)				Function related to: Touch Key Module1
TKM1TMRH	197.5~0	R/W	0	STK Module1 reference counter MSB [11~8]
TKM2TMRL (198h)				Function related to: Touch Key Module2
TKM2TMRL	198.7~0	R/W	FF	STK Module2 reference counter LSB [7~0]
TKM2TMRH (199h)				Function related to: Touch Key Module2
TKM2TMRH	199.5~0	R/W	0	STK Module2 reference counter MSB [11~8]
TKM0REFC (19Ah)				Function related to: Touch Key Module0
TKM0REFC	19A.7~0	R/W	-	STK Module0 Reference clock capacitor select
TKM1REFC (19Bh)				Function related to: Touch Key Module1
TKM1REFC	19B.7~0	R/W	-	STK Module1 Reference clock capacitor select
TKM2REFC (19Ch)				Function related to: Touch Key Module2
TKM2REFC	19C.7~0	R/W	-	STK Module2 Reference clock capacitor select

Name	Address	R/W	Rst	Description
TKMCHS0 (19Dh)				Function related to: Touch Key Module0/1
TKM1CHS	19D.6~4	R/W	0	STK Module1 Channel Select: 0:TK8 1:TK9 2:TK10 3:TK11 4:TK12 5:TK13 6:TK14 7:TK15
TKM0CHS	19D.2~0	R/W	0	STK Module0 Channel Select: 0:TK0 1:TK1 2:TK2 3:TK3 4:TK4 5:TK5 6:TK6 7:TK7
TKMCHS1 (19Eh)				Function related to: Touch Key Module2
TKM2CHS	19E.2~0	R/W	0	STK Module2 Channel Select: 0:TK16 1:TK17 2:TK18 3:TK19 4:TK20 5:TK21 6:TK22 7:TK23
CTRLRFK (19Fh)				Function related to: Touch Key Module2
CTRLRFK	19F.7~0	R/W	0	STK module2 Reference Key(TK23) Capacitor Control 0 : minimum capacitor on TK23 FF: maximum capacitor on TK23
User Data Memory				
RAM	1A0~1EF	R/W	-	RAM Bank3 area (80 Bytes)
Indirect Addressing User Data Memory Use INDF1/FSR1 to access RAM Bank 4/5				
RAM	20~ 6F	R/W	-	Indirect Addressing RAM Bank4 area (80 Bytes); use INDF1/FSR1
RAM	A0~EF	R/W	-	Indirect Addressing RAM Bank5 area (80 Bytes); use INDF1/FSR1

INSTRUCTION SET

Each instruction is a 16-bit word divided into an Op Code, which specifies the instruction type, and one or more operands, which further specify the operation of the instruction. The instructions can be categorized as byte-oriented, bit-oriented and literal operations list in the following table.

For byte-oriented instructions, “f” represents the address designator and “d” represents the destination designator. The address designator is used to specify which address in Program memory is to be used by the instruction. The destination designator specifies where the result of the operation is to be placed. If “d” is “0”, the result is placed in the W register. If “d” is “1”, the result is placed in the address specified in the instruction.

For bit-oriented instructions, “b” represents a bit field designator, which selects the number of the bit affected by the operation, while “f” represents the address designator. For literal operations, “k” represents the literal or constant value.

Field/Legend	Description
f	Register File Address
b	Bit address
k	Literal. Constant data or label
d	Destination selection field, 0: Working register, 1: Register file
W	Working Register
Z	Zero Flag
C	Carry Flag or/Borrow Flag
DC	Decimal Carry Flag or Decimal/Borrow Flag
PC	Program Counter
TOS	Top Of Stack
GIE	Global Interrupt Enable Flag (i-Flag)
[]	Option Field
()	Contents
.	Bit Field
B	Before
A	After
←	Assign direction

Mnemonic		Op Code	Cycle	Flag Affect	Description
Byte-Oriented File Register Instruction					
ADDW X	f, d	ff00 0111 dfff ffff	1	C, DC, Z	Add W and "f"
ANDW X	f, d	ff00 0101 dfff ffff	1	Z	AND W with "f"
CLR X	f	ff00 0001 1fff ffff	1	Z	Clear "f"
CLRW		0000 0001 0100 0000	1	Z	Clear W
COM X	f, d	ff00 1001 dfff ff ff	1	Z	Complement "f"
DEC X	f, d	ff00 0011 dfff ffff	1	Z	Decrement "f"
DECXSZ	f, d	ff00 1011 dfff ffff	1 or 2	-	Decrement "f", skip if zero
INC X	f, d	ff00 1010 dfff ffff	1	Z	Increment "f"
INCXSZ	f, d	ff00 1111 dfff ffff	1 or 2	-	Increment "f", skip if zero
IORW X	f, d	ff00 0100 dfff ffff	1	Z	OR W with "f"
MOV X	f,d	ff00 1000 dfff ffff	1	Z	Move "f"
MOVXW	f	ff00 1000 0fff ffff	1	Z	Move "f" to W
MOVW X	f	ff00 0000 1fff ffff	1	-	Move W to "f"
RL X	f, d	ff00 1101 dfff ffff	1	C	Rotate left "f" through carry
RR X	f, d	ff00 1100 dfff ffff	1	C	Rotate right "f" through carry
SUBW X	f, d	ff00 0010 dfff ffff	1	C, DC, Z	Subtract W from "f"
SWAP X	f, d	ff00 1110 dfff ffff	1	-	Swap nibbles in "f"
TST X	f	ff00 1000 1fff ffff	1	Z	Test if "f" is zero
XORW X	f, d	ff00 0110 dfff ffff	1	Z	XOR W with "f"
Bit-Oriented File Register Instruction					
BC X	f, b	ff11 00bb bfff ffff	1	-	Clear "b" bit of "f"
BS X	f, b	ff11 01bb bfff ffff	1	-	Set "b" bit of "f"
BTXSC	f, b	ff11 10bb bfff ffff	1 or 2	-	Test "b" bit of "f", skip if clear
BTXSS	f, b	ff11 11bb bfff ffff	1 or 2	-	Test "b" bit of "f", skip if set
Literal and Control Instruction					
ADDLW	k	0001 1100 kkkk kkkk	1	C, DC, Z	Add Literal "k" and W
ANDLW	k	0001 1011 kkkk kkkk	1	Z	AND Literal "k" with W
LCALL	k	kk10 0kkk kkkk kkkk	2	-	Call subroutine "k"
CLRWD T		0001 1110 0000 0100	1	TO, PD	Clear Watch Dog Timer
LGOTO	k	kk10 1kkk kkkk kkkk	2	-	Jump to branch "k"
IORLW	k	0001 1010 kkkk kkkk	1	Z	OR Literal "k" with W
MOVLW	k	0001 1001 kkkk kkkK	1	-	Move Literal "k" to W
NOP		0000 0000 0000 0000	1	-	No operation
RET		0000 0000 0100 0000	2	-	Return from subroutine
RETI		0000 0000 0110 0000	2	-	Return from interrupt
RETLW	k	0001 1000 kkkk kkkk	2	-	Return with Literal in W
SLEEP		0001 1110 0000 0011	1	TO, PD	Go into Power-down mode, Clock oscillation stops
SUBLW	k	0001 1111 kkkk kkkk	1	C, DC, Z	Subtract W from literal
TABRH		0000 0000 0101 1000	2	-	Lookup ROM high data to W
TABRL		0000 0000 0101 0000	2	-	Lookup ROM low data to W
XORLW	k	0001 1101 kkkk kkkk	1	Z	XOR Literal "k" with W

ADDLW	Add Literal "k" and W	
Syntax	ADDLW k	
Operands	k : 00h ~ FFh	
Operation	$(W) \leftarrow (W) + k$	
Status Affected	C, DC, Z	
OP-Code	0001 1100 kkkk kkkk	
Description	The contents of the W register are added to the eight-bit literal 'k' and the result is placed in the W register.	
Cycle	1	
Example	ADDLW 0x15	B : W =0x10 A : W =0x25

ADDWX	Add W and "f"	
Syntax	ADDWX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	$(\text{destination}) \leftarrow (W) + (f)$	
Status Affected	C, DC, Z	
OP-Code	ff00 0111 dfff ffff	
Description	Add the contents of the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	ADDWX FSR, 0	B : W =0x17, FSR =0xC2 A : W =0xD9, FSR =0xC2

ANDLW	Logical AND Literal "k" with W	
Syntax	ANDLW k	
Operands	k : 00h ~ FFh	
Operation	$(W) \leftarrow (W) \text{ AND } k$	
Status Affected	Z	
OP-Code	0001 1011 kkkk kkkk	
Description	The contents of W register are AND'ed with the eight-bit literal 'k'. The result is placed in the W register.	
Cycle	1	
Example	ANDLW 0x5F	B : W =0xA3 A : W =0x03

ANDWX	AND W with "f"	
Syntax	ANDWX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	$(\text{destination}) \leftarrow (W) \text{ AND } (f)$	
Status Affected	Z	
OP-Code	ff00 0101 dfff ffff	
Description	AND the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	ANDWX FSR, 1	B : W =0x17, FSR =0xC2 A : W =0x17, FSR =0x02

BCX		Clear "b" bit of "f"	
Syntax	BCX f [,b]		
Operands	f : 00h ~ 1FFh, b : 0 ~ 7		
Operation	(f.b) ← 0		
Status Affected	-		
OP-Code	ff11 00bb bfff ffff		
Description	Bit 'b' in register 'f' is cleared.		
Cycle	1		
Example	BCX FLAG_REG, 7	B : FLAG_REG =0xC7	A : FLAG_REG =0x47
BSX		Set "b" bit of "f"	
Syntax	BSX f [,b]		
Operands	f : 00h ~ 1FFh, b : 0 ~ 7		
Operation	(f.b) ← 1		
Status Affected	-		
OP-Code	ff11 01bb bfff ffff		
Description	Bit 'b' in register 'f' is set.		
Cycle	1		
Example	BSX FLAG_REG, 7	B : FLAG_REG =0x0A	A : FLAG_REG =0x8A
BTXSC		Test "b" bit of "f", skip if clear(0)	
Syntax	BTXSC f [,b]		
Operands	f : 00h ~ 1FFh, b : 0 ~ 7		
Operation	Skip next instruction if (f.b) =0		
Status Affected	-		
OP-Code	ff11 10bb bfff ffff		
Description	If bit 'b' in register 'f' is 1, then the next instruction is executed. If bit 'b' in register 'f' is 0, then the next instruction is discarded, and a NOP is executed instead, making this a 2nd cycle instruction.		
Cycle	1 or 2		
Example	LABEL1 BTXSC FLAG, 1	B : PC =LABEL1	
	TRUE GOTO SUB1	A : if FLAG.1 =0, PC =FALSE	
	FALSE ...	if FLAG.1 =1, PC =TRUE	
BTXSS		Test "b" bit of "f", skip if set(1)	
Syntax	BTXSS f [,b]		
Operands	f : 00h ~ 1FFh, b : 0 ~ 7		
Operation	Skip next instruction if (f.b) =1		
Status Affected	-		
OP-Code	ff11 11bb bfff ffff		
Description	If bit 'b' in register 'f' is 0, then the next instruction is executed. If bit 'b' in register 'f' is 1, then the next instruction is discarded, and a NOP is executed instead, making this a 2nd cycle instruction.		
Cycle	1 or 2		
Example	LABEL1 BTXSS FLAG, 1	B : PC =LABEL1	
	TRUE GOTO SUB1	A : if FLAG.1 =0, PC =TRUE	
	FALSE ...	if FLAG.1 =1, PC =FALSE	

COMX	Complement 'f'	
Syntax	COMX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (\bar{f})	
Status Affected	Z	
OP-Code	ff00 1001 dfff ffff	
Description	The contents of register 'f' are complemented. If 'd' is 0, the result is stored in W. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	COMX REG1, 0	B : REG1 =0x13 A : REG1 =0x13, W =0xEC
<hr/>		
DECX	Decrement 'f'	
Syntax	DECX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (f) - 1	
Status Affected	Z	
OP-Code	ff00 0011 dfff ffff	
Description	Decrement register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	DECX CNT, 1	B : CNT =0x01, Z =0 A : CNT =0x00, Z =1
<hr/>		
DECXSZ	Decrement 'f', Skip if 0	
Syntax	DECXSZ f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (f) - 1, skip next instruction if result is 0	
Status Affected	-	
OP-Code	ff00 1011 dfff ffff	
Description	The contents of register 'f' are decremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, then a NOP is executed instead, making it a 2 cycle instruction.	
Cycle	1 or 2	
Example	LABEL1 DECXSZ CNT, 1 GOTO LOOP CONTINUE	B : PC =LABEL1 A : CNT =CNT - 1 if CNT =0, PC =CONTINUE if CNT ≠0, PC =LABEL1 + 1
<hr/>		
LGOTO	Unconditional Branch	
Syntax	LGOTO k	
Operands	k : 000h ~ 1FFFh	
Operation	PC.10~0 ← k	
Status Affected	-	
OP-Code	kk10 1kkk kkkk kkkk	
Description	GOTO is an unconditional branch. The 13-bit immediate value is loaded into PC bits <12:0>.The upper bits of PC are loaded from PCLATH. GOTO is a two-cycle instruction.	
Cycle	2	
Example	LABEL1 LGOTO SUB1	B : PC =LABEL1 A : PC =SUB1

INCX	Increment "f"	
Syntax	INCX f [,d]	
Operands	f : 00h ~ 1FFh	
Operation	(destination) ← (f) + 1	
Status Affected	Z	
OP-Code	ff00 1010 dfff ffff	
Description	The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'.	
Cycle	1	
Example	INCX CNT, 1	B : CNT =0xFF, Z =0 A : CNT =0x00, Z =1
INCXSZ	Increment "f", Skip if 0	
Syntax	INCXSZ f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (f) + 1, skip next instruction if result is 0	
Status Affected	-	
OP-Code	ff00 1111 dfff ffff	
Description	The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, a NOP is executed instead, making it a 2 cycle instruction.	
Cycle	1 or 2	
Example	LABEL1 INCXSZ CNT, 1 GOTO LOOP CONTINUE	B : PC =LABEL1 A : CNT =CNT + 1 if CNT =0, PC =CONTINUE if CNT ≠0, PC =LABEL1 + 1
IORLW	Inclusive OR Literal with W	
Syntax	IORLW k	
Operands	k : 00h ~ FFh	
Operation	(W) ← (W) OR k	
Status Affected	Z	
OP-Code	0001 1010 kkkk kkkk	
Description	The contents of the W register are OR'ed with the eight-bit literal 'k'. The result is placed in the W register.	
Cycle	1	
Example	IORLW 0x35	B : W =0x9A A : W =0xBF, Z =0
IORWX	Inclusive OR W with "f"	
Syntax	IORWF f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (W) OR k	
Status Affected	Z	
OP-Code	ff00 0100 dfff ffff	
Description	Inclusive OR the W register with register 'f'. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'.	
Cycle	1	
Example	IORWX RESULT, 0	B : RESULT =0x13, W =0x91 A : RESULT =0x13, W =0x93, Z =0

MOVX	Move f
Syntax	MOVX f,d
Operands	f : 00h ~ 1FFh
Operation	(destination) ← (f)
Status Affected	Z
OP-Code	ff00 1000 dfff ffff
Description	The contents of register 'f' are moved to a destination dependent upon the status of d. If d=0, destination is W register. If d =1, the destination is file register f itself. d=1 is useful to test a file register, since status flag Z is affected.
Cycle	1
Example	MOVX FSR,0 B : FSR =0xC2, W =? A : FSR =0xC2, W 0xC2
MOVXW	Move "f" to W
Syntax	MOVXW f
Operands	f : 00h ~ 1FFh
Operation	(W) ← (f)
Status Affected	Z
OP-Code	ff00 1000 0fff ffff
Description	The contents of register 'f' are moved to W register.
Cycle	1
Example	MOVXW FSR B : FSR =0xC2, W =? A : FSR =0xC2, W 0xC2
MOVLW	Move Literal to W
Syntax	MOVLW k
Operands	k : 00h ~ FFh
Operation	(W) ← k
Status Affected	-
OP-Code	0001 1001 kkkk kkkk
Description	The eight-bit literal 'k' is loaded into W register. The don't cares will assemble as 0's.
Cycle	1
Example	MOVLW 0x5A B : W =? A : W =0x5A
MOVWX	Move W to "f"
Syntax	MOVWX f
Operands	f : 00h ~ 1FFh
Operation	(f) ← (W)
Status Affected	-
OP-Code	ff00 0000 1fff ffff
Description	Move data from W register to register 'f'.
Cycle	1
Example	MOVWX REG1 B : REG1 =0xFF, W =0x4F A : REG1 =0x4F, W =0x4F

SUBLW	Subtract W from Literal	
Syntax	SUBLW k	
Operands	k : 00h ~ FFh	
Operation	$(W) \leftarrow k - (W)$	
Status Affected	C, DC, Z	
OP-Code	0001 1111 kkkk kkkk	
Description	The W register is subtracted (2's complement method) from the eight-bit literal "k". The result is placed in the W register.	
Cycle	1	
Example	SUBLW 0x25	B : W =0x15 A : W =0x10

SUBWX	Subtract W from "f"	
Syntax	SUBWX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	$(\text{destination}) \leftarrow (f) - (W)$	
Status Affected	C, DC, Z	
OP-Code	ff00 0010 dfff ffff	
Description	Subtract (2's complement method) W register from register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	SUBWX REG1, 1	B : REG1 =0x03, W =0x02, C =?, Z =? A : REG1 =0x01, W =0x02, C =1, Z =0
	SUBWX REG1, 1	B : REG1 =0x02, W =0x02, C =?, Z =? A : REG1 =0x00, W =0x02, C =1, Z =1
	SUBWX REG1, 1	B : REG1 =0x01, W =0x02, C =?, Z =? A : REG1 =0xFF, W =0x02, C =0, Z =0

SWAPX	Swap Nibbles in "f"	
Syntax	SWAPX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	$(\text{destination}, 7\sim 4) \leftarrow (f.3\sim 0), (\text{destination}.3\sim 0) \leftarrow (f.7\sim 4)$	
Status Affected	-	
OP-Code	ff00 1110 dfff ffff	
Description	The upper and lower nibbles of register 'f' are exchanged. If 'd' is 0, the result is placed in W register. If 'd' is 1, the result is placed in register 'f'.	
Cycle	1	
Example	SWAPX REG, 0	B : REG1 =0xA5 A : REG1 =0xA5, W =0x5A

TABRH Return DPTR high byte to W

Syntax	TABRH		
Operands	-		
Operation	(W) ← ROM[DPTR] high byte content, Where DPTR = {DPH[max:8], FSR[7:0]}		
Status Affected	-		
OP-Code	0000 0000 0101 1000		
Description	The W register is loaded with high byte of ROM[DPTR]. This is a two-cycle instruction.		
Cycle	2		
Example	MOVLW	(TAB1&0xFF)	
	MOVWX	DPL	;Where DPL is register
	MOVLW	(TBA1>>8)&0xFF	
	MOVWX	DPH	;Where DPH is register
	TABRL		;W =0x89
	TABRH		;W =0x37
		ORG 0234H	
	TAB1:		
	DT	0x3789, 0x2277	;ROM data 16 bits

TABRL Return DPTR low byte to W

Syntax	TABRL		
Operands	-		
Operation	(W) ← ROM[DPTR] low byte content, Where DPTR = {DPH[max:8], FSR[7:0]}		
Status Affected	-		
OP-Code	0000 0000 0101 0000		
Description	The W register is loaded with low byte of ROM[DPTR]. This is a two-cycle instruction.		
Cycle	2		
Example	MOVLW	(TAB1&0xFF)	
	MOVWX	DPL	;Where DPL register
	MOVLW	(TBA1>>8)&0xFF	
	MOVWX	DPH	;Where DPH register
	TABRL		;W =0x89
	TABRH		;W =0x37
		ORG 0234H	
	TAB1:		
	DT	0x3789, 0x2277	;ROM data 16 bits

TSTX	Test if "f" is zero	
Syntax	TSTX f	
Operands	f : 00h ~ 1FFh	
Operation	Set Z flag if (f) is 0	
Status Affected	Z	
OP-Code	ff00 1000 1fff ffff	
Description	If the content of register 'f' is 0, Zero flag is set to 1.	
Cycle	1	
Example	TSTX REG1	B : REG1 =0, Z =? A : REG1 =0, Z =1

XORLW	Exclusive OR Literal with W	
Syntax	XORLW k	
Operands	k : 00h ~ FFh	
Operation	(W) ← (W) XOR k	
Status Affected	Z	
OP-Code	0001 1101 kkkk kkkk	
Description	The contents of the W register are XOR'ed with the eight-bit literal 'k'. The result is placed in the W register.	
Cycle	1	
Example	XORLW 0xAF	B : W =0xB5 A : W =0x1A

XORWX	Exclusive OR W with "f"	
Syntax	XORWX f [,d]	
Operands	f : 00h ~ 1FFh, d : 0, 1	
Operation	(destination) ← (W) XOR (f)	
Status Affected	Z	
OP-Code	ff00 0110 dfff ffff	
Description	Exclusive OR the contents of the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.	
Cycle	1	
Example	XORWX REG, 1	B : REG =0xAF, W =0xB5 A : REG =0x1A, W =0xB5

ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$)

Parameter	Rating	Unit
Supply voltage	$V_{SS} - 0.3$ to $V_{SS} + 5.5$	V
Input voltage	$V_{SS} - 0.3$ to $V_{CC} + 0.3$	
Output voltage	$V_{SS} - 0.3$ to $V_{CC} + 0.3$	
Output current high per 1 PIN	-25	mA
Output current high per all PIN	-80	
Output current low per 1 PIN	+30	
Output current low per all PIN	+150	
Maximum operating voltage	5.5	V
Operating temperature	-40 to +105	°C
Storage temperature	-65 to +150	

2. DC Characteristics ($T_A = 25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$, unless otherwise specified)

Parameter	Sym	Conditions		Min	Typ	Max	Unit
Operating Voltage	V_{CC}	$F_{sys} = 18.432\text{Mhz}$		2.8		5.5	
		$F_{sys} = 9.2\text{Mhz}$		LVR		5.5	
Input High Voltage	V_{IH}	All Input	$V_{CC} = 3\sim 5\text{V}$	$0.6V_{CC}$	-	V_{CC}	V
Input Low Voltage	V_{IL}	All Input	$V_{CC} = 3\sim 5\text{V}$	V_{SS}	-	$0.2V_{CC}$	V
Output High Current	I_{OH}	All Output	$V_{CC} = 5\text{V}, V_{OH} = 4.5\text{V}$ LED[x]=0	10	12	-	mA
			$V_{CC} = 5\text{V}, V_{OH} = 3.5\text{V}$ LED[x]=1	15	19		
			$V_{CC} = 3\text{V}, V_{OH} = 2.7\text{V}$ LED[x]=0	4	5	-	
			$V_{CC} = 3\text{V}, V_{OH} = 2.1\text{V}$ LED[x]=1	6	8		
Output Low Current	I_{OL}	All Output	$V_{CC} = 5\text{V}, V_{OL} = 0.5\text{V}$ HSNK[x]=0	33	42	-	mA
			$V_{CC} = 5\text{V}, V_{OL} = 0.5\text{V}$ HSNK[x]=1	60	70		
			$V_{CC} = 3\text{V}, V_{OL} = 0.3\text{V}$ HSNK[x]=0	15	19	-	
			$V_{CC} = 3\text{V}, V_{OL} = 0.3\text{V}$ HSNK[x]=1	27	34		
Input Leakage Current (pin high)	I_{ILH}	All Input	$V_{IN} = V_{CC}$	-	-	1	μA
Input Leakage Current (pin low)	I_{ILL}	All Input	$V_{IN} = 0\text{V}$	-	-	-1	μA

Parameter	Sym	Conditions	Min	Typ	Max	Unit			
Power Supply Current (No Load)	I _{CC}	FAST mode FXT 20MHz	V _{CC} = 5V	–	7.3	–	mA		
			V _{CC} = 3V		4.1				
		FAST mod FIRC 18.4 MHz	V _{CC} = 5V		7				
			V _{CC} = 3V		4				
		FAST mode FIRC 9.2 MHz	V _{CC} = 5V		5.1				
			V _{CC} = 3V		3.1				
				FAST mode FIRC 4.6 MHz	V _{CC} = 5V	–	4.2	–	
					V _{CC} = 3V		2.6		
				FAST mode FIRC 2.3 MHz	V _{CC} = 5V	–	3.7	–	
					V _{CC} = 3V	–	2.3	–	
				SLOW mode SIRC 50KHz FIRC STOP	V _{CC} = 5.0V	–	2.2	–	mA
					V _{CC} = 3.0V	–	1.6	–	
		IDLE mode SIRC 50 KHz	V _{CC} = 5.0V	–	6.5	–	uA		
			V _{CC} = 3.0V	–	2.1	–			
		STOP mode POR/LVR Off	V _{CC} = 5.0V	–	–	1	uA		
			V _{CC} = 3.0V	–	–	1			
Pull-up Resistor	R _{UP}	V _{IN} = 0 V Ports A/B/C/D	V _{CC} = 5.0V	–	32	–	K Ω		
			V _{CC} = 3.0V	–	56	–			

3. Clock Timing (T_A = -40°C to +85°C)

Parameter	Condition	Min	Typ	Max	Unit
FIRC Frequency (*)	25°C, V _{CC} = 5.0 V	-1%	18.432	+1%	MHz
	-40°C ~ 105°C, V _{CC} = 5.0 V	-1.5%	18.432	+1.5%	
	-40°C ~ 105°C, V _{CC} = 3.0 ~ 5.0V	-2.5%	18.432	+2.5%	

(*) FIRC frequency can be divided by 1/2/4/8.

4. Reset Timing Characteristics (T_A = -40°C to +85°C)

Parameter	Conditions	Min	Typ	Max	Unit
RESET Input Low width	Input V _{CC} = 5 V ±10 %	–	30	–	μs
WDT time	V _{CC} = 3 V, WDT _{PSC} = 11	–	1520	–	ms
	V _{CC} = 5 V, WDT _{PSC} = 11		1360		
WKT time	V _{CC} = 3 V, WKT _{PSC} = 11	–	190	–	ms
	V _{CC} = 5 V, WKT _{PSC} = 11		170		
CPU start up time	V _{CC} = 5 V	–	38	–	ms

5. EEPROM Characteristics

Parameter	Conditions	Min	Typ	Max	Units
Write Voltage, V _{cc}	-20°C ~ 105°C	3.0	5	5.5	V
	-40°C ~ 105°C	3.5	5	5.5	V
Write Endurance ⁽¹⁾	V _{cc} =3.0~5.5V, -10~105°C	30K			cycles
	V _{cc} =3.0~5.5V, -20 ~105°C	40K			cycles
	V _{cc} =3.0~5.5V, -10~ 105°C	50K			cycles

Note:1 The value of this parameter is based on the characteristics of tested samples

6. LVR Circuit Characteristics (T_A = 25°C)

Parameter	Sym	Conditions	Min	Typ	Max	Unit
LVR Reference Voltage	V _{LVR}	T _A = 25°C	-	4.15	-	V
			-	4.01	-	
			-	3.87	-	
			-	3.73	-	
			-	3.59	-	
			-	3.45	-	
			-	3.31	-	
			-	3.17	-	
			-	3.03	-	
			-	2.89	-	
			-	2.75	-	
			-	2.62	-	
			-	2.47	-	
LVD Reference Voltage	V _{LVD}	T _A = 25°C	-	4.15	-	V
			-	4.01	-	
			-	3.87	-	
			-	3.73	-	
			-	3.59	-	
			-	3.45	-	
			-	3.31	-	
			-	3.17	-	
			-	3.03	-	
			-	2.89	-	
			-	2.75	-	
			-	2.62	-	
			-	2.47	-	
LVR Hysteresis Voltage	V _{HYST}	T _A = 25°C	-	±0.1	-	V
Low Voltage Detection time	t _{LVR}	T _A = 25°C	100	-	-	μs

7. ADC Electrical Characteristics ($T_A = 25^\circ\text{C}$, $V_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = 0\text{V}$)

Parameter	Conditions	Min	Typ	Max	Units
Total Accuracy	$V_{CC} = 5\text{V}$, $V_{SS} = 0\text{V}$, $F_{ADC} = 1\text{MHz}$	–	± 3	± 13	LSB
Integral Non-Linearity		–	± 3.2	± 15	
Differential Non-linearity		–	± 1	± 4	
Max Input Clock freq. (F_{ADC})	Source impedance ($R_s < 10\text{K ohm}$)	–	–	2	MHz
	Source impedance ($R_s < 20\text{K ohm}$)	–	–	1	
	Source impedance ($R_s < 50\text{K ohm}$)	–	–	0.5	
	Source is VBG (ADCHS=01110)	–	–	2	
Conversion Time	$F_{ADC} = 1\text{MHz}$	–	50	–	μs
BandGap Voltage Reference (VBG)	$-20^\circ\text{C} \sim 105^\circ\text{C}$, $V_{CC} = 3.0 \sim 5.0\text{V}$	-2%	1.2	+1.5%	V
ADC reference voltage (V_{REF}) (ADCVREFS=1)	$-20^\circ\text{C} \sim 105^\circ\text{C}$, $V_{CC} = 3.0 \sim 5.0\text{V}$	-2.5%	2.5	+2%	
$V_{CC}/4$ reference voltage	25°C , $V_{CC} = 3.0 \sim 5.0\text{V}$	-1%	$0.25 * V_{CC}$	1%	
Input Voltage	–	V_{SS}	–	V_{CC}
